## Introduction

This Surveying Applications book was written to help you get the most from your HP-33E calculator. The programs were chosen to provide useful calculations for many of the common problems encountered in surveying.
They will provide you with immediate capabilities in your everyday calculations and you will find them useful as guides to programming techniques for writing your own customized software.

You will find general information on how to key in and run programs under "A Word about Program Usage" in the Applications book you received with your calculator.
We hope that this Surveying book will be a valuable tool in your work and would appreciate your comments about it.

## Contents

## Traversing

## Azimuth-Bearing Conversions

Angle conventions for azimuths and quadrant bearings as used in this application book are shown below:

Thus azimuths are measured from the north meridian following North American surveying conventions. Bearings are measured from the meridian in the quadrant in which the line falls. Quadrant codes are shown in the above sketch.

Often it is desirable to have a quick, easy method to convert to or from azimuths and bearings. In this application book, for example, some inputs and outputs may be in azimuths rather than bearings, or vice versa, when you desire the alternate form. The following simple keystroke routines are helpful in making these conversions:

| STEP | INSTRUCTIONS | INPUT DATA/UNITS | KEYS | OUTPUT DATA/UNITS |
| :---: | :---: | :---: | :---: | :---: |
|  | Azimuths to Bearings: |  |  |  |
| 1 | Azimuth $=0^{\circ}$ to $90^{\circ}$ | AZ (D.MS) | No Calculation | BRG (D.MS) |
|  |  |  |  | QD $=1$ |
| 2 | Azimuth $=90^{\circ}$ to $180^{\circ}$ | 180 | ENTER4 |  |
|  |  | AZ (D.MS) | (9) $\rightarrow$ - $\square$ |  |
|  |  |  | (1) $\rightarrow$ H.MS | BRG (D.MS) |
|  |  |  |  | $Q D=2$ |
| 3 | Azimuth $=180^{\circ}$ to $270^{\circ}$ | AZ (D.MS) | ENTER4 $180 \square$ | BRG (D.MS) |
|  |  |  |  | $Q D=3$ |
| 4 | Azimuth $=270^{\circ}$ to $360^{\circ}$ | 360 | ENTER4 |  |
|  |  | AZ (D.MS) | (9) $\rightarrow$ H - |  |
|  |  |  | $\rightarrow \rightarrow$ H.MS | BRG (D.MS) |
|  |  |  |  | $Q D=4$ |
|  | Bearings to Azimuths: |  |  |  |
| 5 | Quadrant $=1$ | BRG (D.MS) | No Calculation | AZ (D.MS) |
| 6 | Quadrant $=2$ | 180 | ENTER4 |  |
|  |  | BRG (D.MS) | (9) +H |  |
|  |  |  | (f) $\rightarrow$ H.MS | AZ (D.MS) |
| 7 | Quadrant = 3 | BRG (D.MS) | ENTER4 180 + | AZ (D.MS) |
| 8 | Quadrant $=4$ | 360 | ENTER4 |  |
|  |  | BRG (D.MS) | (9) $\rightarrow$ H - |  |
|  |  |  | (f) $\rightarrow$ H.MS | AZ (D.MS) |

If you have a number of conversions to perform the following program will be more convenient and faster. Lines 01 thru 24 convert bearings to azimuths. Lines 25 thru 39 convert azimuths to bearings. You may want to separate the two parts and only key in one section, if all your conversions are in one direction.

## Bearing Traverse

This program uses bearings and horizontal distances or slope distances to calculate coordinates in a surveying traverse. Starting from a known point, the calculations proceed point by point around the traverse. The total horizontal distance traversed is calculated as well as the area enclosed by the traverse (if it is a closed traverse).

## Formulas Used:

1. $\mathrm{HD}=\mathrm{SD} \sin (\mathrm{ZA})$
2. $\mathrm{N}_{\mathrm{k}+1}=\mathrm{N}_{\mathrm{k}}+\mathrm{HD} \cos \mathrm{AZ}$
$\mathrm{LAT}_{\mathrm{k}}=\mathrm{N}_{\mathrm{k}+1}-\mathrm{N}_{\mathrm{k}}$
3. $E_{k+1}=E_{k}+H D \sin A Z$
$D E P_{k}=E_{k+1}-E_{k}$
4. Area $=\sum_{k=1}^{n} \operatorname{LAT}_{k}\left(1 / 2 \operatorname{DEP}_{k}+\sum_{j=1}^{k-1} \operatorname{DEP}_{j}\right)$
where: $\quad \mathrm{N}, \mathrm{E}=$ Northing, easting of a point
Subscript k refers to current point $n$ equals number of points in the survey

$$
\begin{aligned}
& \mathrm{AZ}=\text { Azimuth of a course } \\
& \mathrm{HD}=\text { Horizontal distance } \\
& \mathrm{SD}=\text { Slope distance } \\
& \mathrm{ZA}=\text { Zenith angle }
\end{aligned}
$$

- All angular inputs and outputs are in the form degrees, minutes and seconds (D.MS).
- This program uses zenith angles to calculate horizontal distance from slope distance. If your instrument measures vertical angles rather than zenith angles, convert the vertical angle to a zenith angle by the following formula:

Zenith angle $=90^{\circ}$ - Vertical angle
(Remember to convert D.MS input to decimal degrees before subtracting from $90^{\circ}$ ).

## Field Angle Traverse

This program calculates coordinates of a traverse from field angles and horizontal or slope distances. The total horizontal distance traversed and the enclosed area (for a closed traverse) are also calculated.
In running this program, the user inputs the northing and easting of his starting point, the reference azimuth, and then the direction and distance from each point in the traverse to the next point. The direction may be input either as a deflection right or left, or as an angle right or left. The distance may be input either as horizontal distance, or as slope distance with zenith angle.

## Equations:

$\mathrm{HD}=\mathrm{SD} \sin (\mathrm{ZA})$
$\mathrm{N}_{\mathrm{k}+1}=\mathrm{N}_{\mathrm{k}}+\mathrm{HD} \cos \mathrm{AZ} \quad \quad \mathrm{LAT}_{\mathrm{k}}=\mathrm{N}_{\mathrm{k}+1}-\mathrm{N}_{\mathrm{k}}$
$K_{k+1}=E_{k}+H D \sin A Z$
$D E P_{k}=E_{k+1}-E_{k}$
Area $=\sum_{k=1}^{n} \operatorname{LAT}_{\mathrm{k}}\left(1 / 2 \operatorname{DEP}_{\mathrm{k}}+\sum_{\mathrm{j}=1}^{\mathrm{k}-1} \mathrm{DEP}_{\mathrm{j}}\right)$
where: $\quad \mathrm{N}, \mathrm{E}=$ Northing, easting of a point
Subscript k refers to current point
Subscript $n$ equals number of points in the survey
$\mathrm{AZ}=$ Azimuth of a course
HD $=$ Horizontal distance
SD $=$ Slope distance
$\mathrm{ZA}=$ Zenith angle

- All angular inputs and outputs are in the form degrees, minutes and seconds (D.MS).
- This program uses zenith angles to calculate horizontal distance from slope distance. If your instrument measures vertical angles rather than zenith angles, convert the vertical angle to a zenith angle by the
following formula:

$$
\text { Zenith angle }=90^{\circ}-\text { Vertical angle }
$$

(Remember to convert D.MS input to decimal degrees before subtracting from $90^{\circ}$ )

You may wish to key in and run the Compass Rule Adjustment program at this point since data accumulated and stored by this program will already be in the registers ready for use in the example problem for the Compass Rule Adjustment.

## Inverse from Coordinates

This program uses coordinates to calculate distances and bearings between points of a traverse. The area and the sum of the distances inversed are also computed.

$$
\begin{gathered}
H D=\sqrt{\left(N_{i}-N_{i-1}\right)^{2}+\left(E_{i}-E_{i-1}\right)^{2}} \\
A Z=\tan ^{-1} \frac{E_{i}-E_{i-1}}{N_{i}-N_{i-1}}
\end{gathered}
$$

$$
\begin{aligned}
\text { Area }= & 1 / 2\left[\left(N_{2}+N_{1}\right)\left(E_{2}-E_{1}\right)+\left(N_{3}+N_{2}\right)\left(E_{3}-E_{2}\right)+\right. \\
& \left.\ldots\left(N_{n}+N_{1}\right)\left(E_{1}-E_{n}\right)\right]
\end{aligned}
$$

where: $\quad \mathrm{N}, \mathrm{E}=$ Northing, easting of a point
Subscript i refers to current point
Subscript n refers to next to last point
Numeric subscript refers to point number
HD $=$ Horizontal distance
$\mathrm{AZ}=$ Azimuth of a course

- Calculation of area by inversing a closed traverse may be inaccurate in cases where the coordinates are quite large. This may be minimized by using the smallest appropriate coordinates.

## Compass Rule Adjustment*

This program adjusts a traverse by the compass rule. It is intended to be used immediately following the bearing or field traverse programs. In this case, if the calculator has not been turned off or the registers cleared or altered, the necessary data will already be stored in registers 1 thru 3.

If this program is not used immediately after the bearing or field angle traverse or if the storage registers have been altered or the calculator turned off since the traverse was run, enter the following data into the specified storage registers.

| Register | Parameters to be Stored |
| :---: | :--- |
| 1 | Calculated ending northing |
| 2 | Calculated ending easting |
| 3 | Total distance traversed |
| 4 | Correct closing northing |
| 5 | Correct closing easting |

The Inverse From Coordinates program may be used to obtain adjusted bearings, distances and area.

## Formulas Used:

$$
C_{L}=\frac{(\Delta N)(H D)}{\sum H D} \quad C_{D}=\frac{(\Delta E)(H D)}{\sum H D}
$$

where: $\quad C_{L}=$ Correction to latitude of a course
$C_{D}=$ Correction to departure of a course
$\Delta \mathrm{N}=$ Closing latitude
$\Delta \mathrm{E}=$ Closing departure
HD $=$ Length of course to be corrected
$\Sigma$ HD $=$ Total length of traverse

|  | Note: Coordinates must be |  |  |  |
|  | reentered in same sequence |  |  |  |
|  | as originally traversed, start- |  |  |  |
|  | ing at the second point. |  |  |  |
| 5 | For next point return to step 4. |  |  |  |
|  | For new case go to step 2. |  |  |  |

## Example:

Adjust the coordinates of points calculated in the Field Angle Traverse.
Values given below are stored automatically by running the above traverse:

## Register Value

| 1 | 149.9048 | Calculated ending northing |
| :--- | :--- | :--- |
| 2 | 399.7829 | Calculated ending easting |
| 3 | 667.1471 | Total distance traversed |

The following values must be stored manually.

| 4 | 150 | Correct closing northing |
| :--- | :--- | :--- |
| 5 | 400 | Correct closing easting |

Using these values, the compass rule method of adjustment yields the following results:

## Sideshots

This program may be used alone or in conjunction with one of the traverse programs. Used as stand-alone program, the reference bearing from a backsight is entered along with the coordinates of the occupied point. If used with a traverse program, these steps are omitted and data stored by the traverse program is used. In either case, the stored data is not destroyed, and the traverse operation may be carried out from the point occupied.
Slope angles are assumed to be entered as zenith angles. If your instrument measures vertical angles convert to zenith angles by subtracting the vertical angle from $90^{\circ}$.

## Formulas Used:

## Intersections

## Bearing-Bearing Intersection

This program calculates coordinates of the point of intersection of two lines for which the bearing of each line is known and the coordinates of a point on each line are known.

## Formulas Used:

$\mathrm{N}=\mathrm{N}_{1}+\operatorname{Dist}\left(\cos \mathrm{AZ}_{1}\right)$
$\mathrm{E}=\mathrm{E}_{1}+\operatorname{Dist}\left(\sin A Z_{1}\right)$
Dist $=\frac{\text { Dist }_{12} \sin \left(A Z_{2}-A Z_{12}\right)}{\sin \left(A Z_{2}-A Z_{1}\right)}$
where: $\quad A Z_{1}=$ Azimuth of line 1
$\mathrm{AZ}_{2}=$ Azimuth of line 2
$A Z_{12}=$ Azimuth of line from point 1 to point 2
$\mathrm{N}_{1}, \mathrm{E}_{1}=$ Northing, easting of point 1
$\mathrm{N}_{2}, \mathrm{E}_{2}=$ Northing, easting of point 2
$\mathrm{N}, \mathrm{E}=$ Northing, easting of intersection point
Dist $=$ Distance from point 1 to intersection
Dist $_{12}=$ Distance from point 1 to point 2

## Bearing-Distance Intersection

This program calculates the coordinates of the point of intersection of two lines-one of known bearing through known coordinates and the other of known length from a point of known coordinates. Both solutions are computed.
The far solution is obtained by entering the bearing from point 1 and the near solution by entering the bearing into point 1 .

## Formulas Used:

$A Z_{12}=\tan ^{-1} \frac{E_{2}-E_{1}}{N_{2}-N_{1}}$
$\mathrm{h}=$ Dist $_{12} \sin \phi$
$\mathrm{b}=\sqrt{\text { Dist }_{2}{ }^{2}-\mathrm{h}^{2}}$
$\mathrm{N}=\mathrm{N}_{1}+\left[\left(\right.\right.$ Dist $\left.\left._{12} \cos \phi\right)+\mathrm{b}\right] \cos \left(\mathrm{AZ}_{1}\right)$
$E=E_{1}+\left[\left(\right.\right.$ Dist $\left.\left._{12} \cos \phi\right)+b\right] \sin \left(A Z_{1}\right)$
where: $\quad A Z_{12}=$ Azimuth of line from point 1 to point 2 $A Z_{1}=$ Azimuth of line 1 $\phi=$ Angle between line 1 and line from point 1 to point 2 $\mathrm{h}=$ Perpendicular distance from point 2 to line 1
$\mathrm{b}=$ Distance from point of intersection to the point where the perpendicular (h) intersects line 1
Dist $_{2}=$ Length of line 2 (the known distance)
$N_{1}, E_{1}=$ Northing, easting of point 1
$\mathrm{N}_{2}, \mathrm{E}_{2}=$ Northing, easting of point 2
Dist $_{12}=$ Distance from point 1 to point 2

Reverse $A Z=\left\{\begin{array}{l}A Z_{1}+180^{\circ}\left(A Z_{1}<180^{\circ}\right) \\ A Z_{1}-180^{\circ}\left(A Z_{1}>180^{\circ}\right)\end{array}\right.$

## Distance-Distance Intersection

Given two lines, each of known length and originating from two known points, this program computes the intersection coordinates. There are two possible solutions; this program calculates the one found by proceeding in a clockwise direction from the first known point to the second known point. The other solution is found by reversing the entry of the known point coordinates.

## Formulas Used:

$\phi=\cos ^{-1} \frac{\text { Dist }_{12}{ }^{2}+\text { Dist }_{1}{ }^{2}-\text { Dist }_{2}{ }^{2}}{2\left(\text { Dist }_{1}\right)\left(\text { Dist }_{12}\right)}$
$A Z=\tan ^{-1} \frac{E_{2}-E_{1}}{N_{2}-N_{1}}$
$\mathrm{N}=\mathrm{N}_{1}+$ Dist $_{1} \cos (\mathrm{AZ}-\phi)$
$\mathrm{E}=\mathrm{E}_{1}+$ Dist $_{1} \sin (\mathrm{AZ}-\phi)$
where: $\quad \phi=$ Angle between line 1 and line $1 \rightarrow 2$
Dist $_{12}=$ Distance from point 1 to point 2
Dist $_{1}=$ Known distance along line 1
Dist $_{2}=$ Known distance along line 2
$N_{1}, E_{1}=$ Northing, easting of point 1
$\mathrm{N}, \mathrm{E}=$ Northing, easting of intersection point
$A Z=$ Azimuth of line from point 1 to point 2

## Offset from a Point to a Line

Given a point with known coordinates (the base point) on a line of known azimuth and another point of known coordinates offset from the line (the offset point), this program calculates offset distance from the point to the line, the distance from the base point to the point of intersection; the coordinates of the point of intersection and the azimuth from the base point to the offset point and from the offset point to the point of intersection.

## Formulas Used:

$\operatorname{Dist}_{B O}=\sqrt{\left(\mathrm{N}_{\mathrm{B}}-\mathrm{N}_{\mathrm{O}}\right)^{2}+\left(\mathrm{E}_{\mathrm{B}}-\mathrm{E}_{\mathrm{O}}\right)^{2}}$
$\alpha=\mathrm{AZ}_{\mathrm{BI}}-\mathrm{AZ}_{\mathrm{BO}}$
Dist $_{\text {BI }}=$ Dist $_{\text {BO }} \cos \alpha$
Dist $_{\text {OI }}=$ Dist $_{\text {BO }} \sin \alpha$
$\mathrm{N}_{\mathrm{I}}=\mathrm{N}_{\mathrm{B}}+$ Dist $_{\mathrm{BI}} \cos \mathrm{AZ}_{\mathrm{BI}}$
$\mathrm{E}_{\mathrm{I}}=\mathrm{E}_{\mathrm{B}}+$ Dist $_{\mathrm{BI}} \sin \mathrm{AZ}_{\mathrm{BI}}$
where: $\quad N_{B}, E_{B}=$ Coordinates of basepoint
$N_{0}, E_{0}=$ Coordinates of offset point
$N_{I}, E_{I}=$ Coordinates of point of intersection
Dist $_{B C}=$ Distance from base to offset point
Dist $_{B I}=$ Distance from base to point of intersection
Dist $_{\text {OI }}=$ Distance from offset to point of intersection
$A Z_{B I}=$ Azimuth of base line from $P_{B}$
$\alpha=$ Angle between base line and line from base to offset

## Curves

## Curve Solutions

Given the central angle and radius, or central angle and tangent distance this program calculates the chord length, arc length, and either the tangent distance or radius. It also calculates the sector and segment areas.

## Formulas Used:

$\mathrm{C}=2 \mathrm{R} \sin (\Delta / 2)$
$\mathrm{L}=\Delta \mathrm{R}$ ( $\Delta$ in radians)
$\mathrm{T}=\mathrm{R} \tan (\Delta / 2)$
Sector area $=\mathrm{LR} / 2$
Segment area $=$ Sector area $-1 / 2 R^{2} \sin (\Delta)$
where: $\quad \mathrm{R}=$ Radius
$\mathrm{C}=$ Chord length
$\mathrm{L}=$ Arc length
$\mathrm{T}=$ Tangent distance
$\Delta=$ Central angle

## Elevations Along A Vertical Curve

This program calculates the elevation at any specified station along a vertical curve as well as the elevation at the highest or lowest point on the curve and the station at that point. Program inputs are: beginning and ending grades, length of curve, the station and elevation at the beginning of the curve and the station at which elevation is desired.

In the program, stations are entered in the form xxxx.xx for station $x x+x x . x x$. For example, $20+10.00$ is entered as 2010.00.

## Formulas Used:

Elevation at any station $=1 / 2 A Z^{2}+G_{1} Z+E_{0}$
Distance in stations from beginning station to station of lowest elevation $=-\mathrm{G}_{1} / \mathrm{A}$
where: $\quad \mathrm{E}_{0}=$ Elevation at beginning of curve
$\mathrm{Z}=$ Distance in 100 foot stations-measured from beginning
of curve
$\mathrm{G}_{1}=$ Grade in $\%$ at beginning of curve
$\mathrm{G}_{2}=$ Grade in $\%$ at end of curve
$A=100\left(G_{2}-G_{1}\right) / L$
$\mathrm{L}=$ Length of curve in feet

## Other

## Earthwork: Volume by Average End Area

This program calculates earthwork volumes by average end area. The required information is the elevation and offset distance (distance from centerline) for each point on the cross-section and the interval between cross-sections. The program calculates accumulated volume to the present station, volume from the previous station, and area of the cross-section.

## Formulas Used:

$\mathrm{VOL}=\left(\mathrm{AREA}_{\mathrm{i}}+\mathrm{AREA}_{\mathrm{i}-1}\right) \frac{\mathrm{INT}}{2}$
AREA $=1 / 2\left[E L_{1}\left(D_{2}-D_{n}\right)+\ldots+E L_{n}\left(D_{1}-D_{n}-1\right)\right]$
where: $\quad$ VOL $=$ Average volume between two stations
AREA $=$ Cross-sectional area at a station
INT $=$ Interval between stations
EL = Elevation at a point on a cross-section
D $=$ Horizontal distance (offset) from centerline
$\mathrm{i}=$ Subscript referring to current point
$\mathrm{n}=$ Subscript referring to last point
Numeric subscript refers to point or station number

- Volumes are calculated in cubic yards, areas in square feet. If you desire to have volumes calculated in cubic feet delete 54 at steps $26 \& 27$ and insert 2 in its place.
- It makes no difference what point you start with on the cross-section, and the elevations and distances may be measured from any base lines as long as the same lines are used for the whole section. Also, you may work around the section clockwise (CW) or counter clockwise (CCW).

| REGISTERS |  |  |  |
| :--- | :--- | :--- | :--- |

## Coordinate Transformation

This program translates, rotates, and rescales coordinates. The traverse rotation angle is entered as a negative value for counterclockwise rotation and positive for clockwise rotation. The translation factors are calculated by entering old and new grid system coordinates for the same point; rotation is also about this point.

## Formulas Used:

$$
\begin{aligned}
& A Z_{R}=\phi+\tan ^{-1} \frac{E_{i}-E_{p}}{N_{i}-N_{p}} \\
& H D_{S}=S \sqrt{\left(N_{i}-N_{\mathrm{p}}\right)^{2}+\left(E_{i}-E_{p}\right)^{2}} \\
& N=H D_{S} \cos \left(A Z_{R}\right)+N_{T 1} \\
& E=H D_{S} \sin \left(A Z_{R}\right)+E_{T 1}
\end{aligned}
$$

where: $\quad A Z_{R}=$ Rotated azimuth
$\phi=$ Rotation angle
$N_{i}, E_{i}=$ Northing, easting of current point before transformation
$N_{p}, E_{p}=$ Original northing, easting of pivot point
$\mathrm{HD}_{\mathrm{S}}=$ Scaled horizontal distance
$\mathrm{S}=$ Scale factor
$\mathrm{N}, \mathrm{E}=$ Northing, easting after transformation
$\mathrm{N}_{\mathrm{T} 1}, \mathrm{E}_{\mathrm{T} 1}=\underset{\text { mation }}{\text { Northing, easting of pivot point after transfor- }}$
