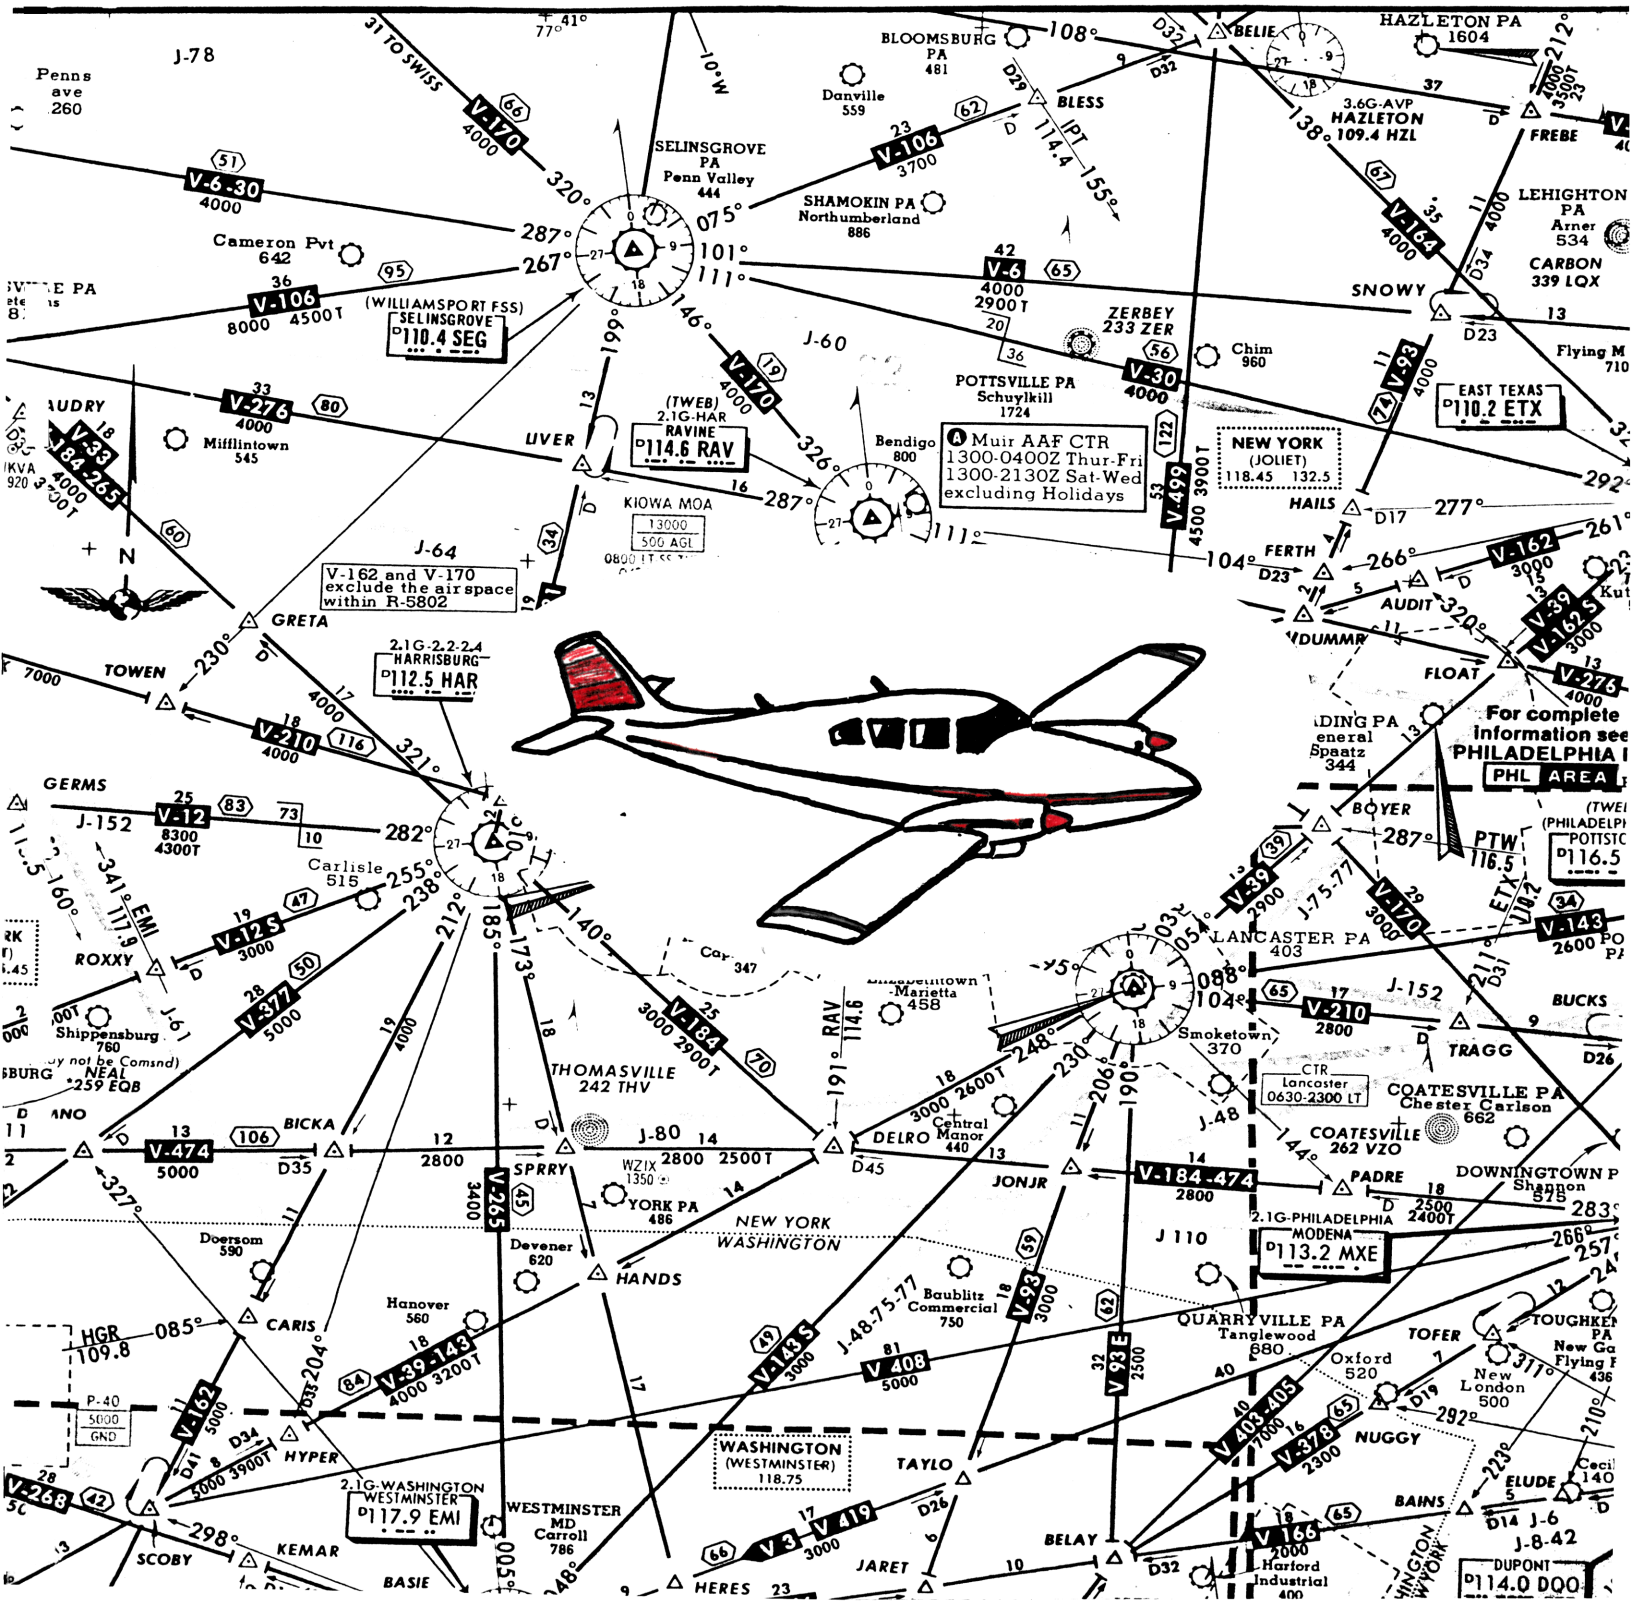
AREA NAVIGATION

RNAV Program for the HP 41C/CV

by

Robert A. Tims

and Other Programs



AIR NAVIGATION/*RNAV*
NAVIGATION FORMULAS

DISTANCE: The Great Circle distance between fixes is calculated by the following formulas:

$$d=\cos^{-1}[\sin(LAT)\sin(LAT')+\cos(LAT)\cos(LAT')\cos(LNG-LNG')]$$

$$(\text{Distance in NM})=60d$$

Where: LAT′ and LNG′ are the coordinates of the "from" fix.
LAT and LNG are the coordinates of the "to" fix.

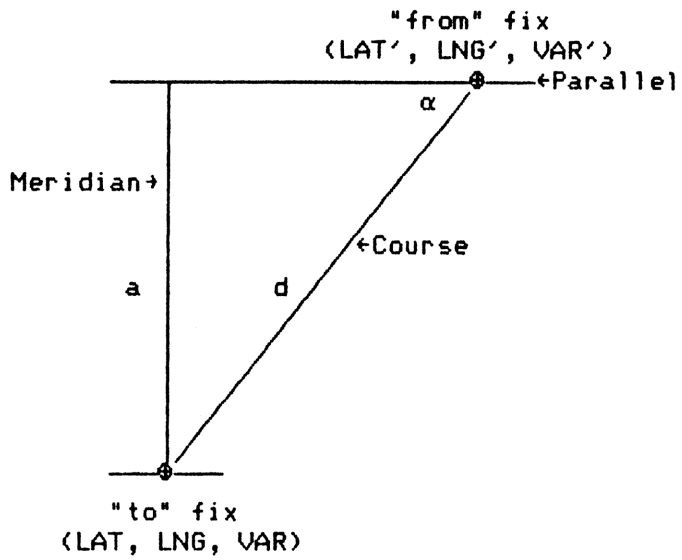
Using Atari functions the formula for d is:

$$d=90-\tan^{-1}[X/(1-X^2)^2]$$
$$X=[\sin(LAT)\sin(LAT')+\cos(LAT)\cos(LAT')\cos(LNG-LNG')]$$

AIR NAVIGATION/*RNAV*
NAVIGATION FORMULAS

COURSE: The course is derived by finding the angle "α" between the parallel passing through the "from" fix and the Course. The angle "α" is then corrected for East/West direction of travel.

A diagram illustrating the relationships is given below with the formulas:



$a=COS^{-1}(Y)$ Atari functions: $a=90-TAN^{-1}[Y/(1-Y^2)^2]$
Where $Y=[SIN(LAT)SIN(LAT')+COS(LAT)COS(LAT')]$

$d=COS^{-1}(X)$ Atari functions: $d=90-TAN^{-1}[X/(1-X^2)^2]$
Where $X=[SIN(LAT)SIN(LAT')+COS(LAT)COS(LAT')COS(LNG-LNG')]$

$\alpha=SIN^{-1}(A)$ Atari functions: $\alpha=TAN^{-1}[A/(1-A^2)^2][SGN(LAT-LAT')]$
Where $A=SIN(a)/SIN(d)$

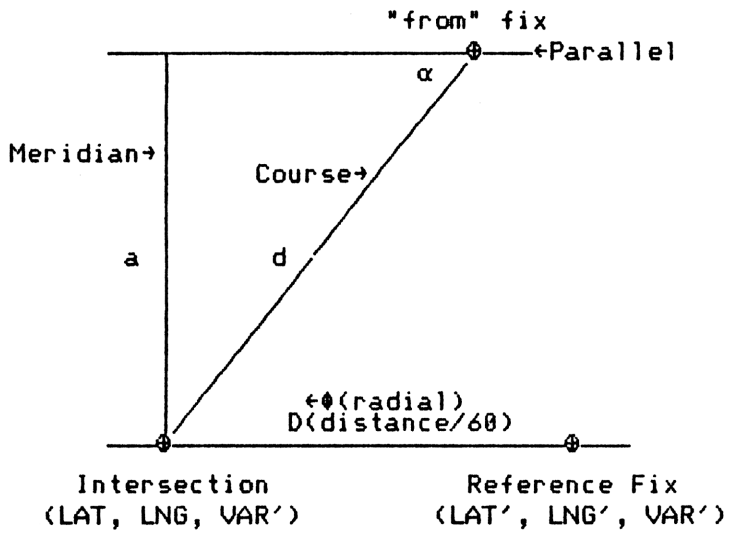
If $(LNG'-LNG)<0$ then $TC=270+\alpha$ (Westerly direction of travel.)
If $(LNG'-LNG)\geq 0$ then $TC=90-\alpha$ (Easterly direction of travel.)

MC=TC+VAR', and if VAR≠VAR' then MC=TC+VAR'/TC+VAR

AIR NAVIGATION/*RNAV*
NAVIGATION FORMULAS

INTERSECTIONS: Intersections are always defined by the radial (magnetic bearing) and distance from a known fix (reference navaid). The program uses this information along with the coordinates of the reference fix to derive the coordinates of the intersection. These coordinates are then used the same as the coordinates of any other fix.

A diagram illustrating the relationships and the formulas is given below:



$LAT=LAT'+SIN^{-1}[(SIN\ D)(COS\ \Phi)]$

$LNG=LNG'-SIN^{-1}[[(SIN\ D)(SIN\ \Phi)]/[COS[(LAT+LAT')/2]]$

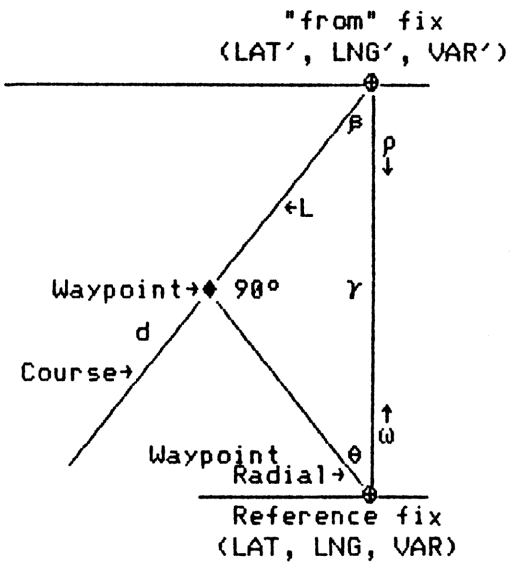
The formulas using Atari functions:

$LAT=LAT'+TAN^{-1}[X/(1-X^2)^2]$
Where $X=(SIN\ D)(COS\ \Phi)$

$LNG=LNG'-TAN^{-1}[Y/(1-Y^2)^2]$
Where $Y=[(SIN\ D)(SIN\ \Phi)]/COS[(LAT+LAT')/2]$

AIR NAVIGATION/*RNAV*
NAVIGATION FORMULAS

WAYPOINTS: Waypoints are calculated by deriving the bearing and distance of the waypoint from the reference navaid along the radial that is perpendicular to the course. This will form a spherical right triangle between the waypoint, reference navaid, and the "from" fix:



The bearing (ρ) and distance angle (γ) from the "from" fix to the reference fix is calculated first. The angle, γ, is calculated with the same formula as used to find the course distance angle (d), and ρ is calculated the same way as the true course. The bearing (ω) from the reference fix to the "from" fix and is the reciprocal of ρ, ω=ρ±180. The angle, β, is the difference between the bearing (ρ) and the true course. This angle is expressed as:

$$-180° \leq \beta \leq 180°$$

If $\beta > |90°|$ then the way point will not be usable because it will occur the other side of the "from" fix.

AIR NAVIGATION/*RNAV*
NAVIGATION FORMULAS

The distance (L) between the "from" fix and the waypoint is calculated with the following formula:

$$L=60[SIN^{-1}[SIN(|\theta|)SIN(\gamma)]] \qquad \theta=90-\beta$$

Using the Atari functions the formula becomes:

$$L=60[TAN^{-1}[X/(1-X^2)^2]]$$

Where $X=SIN(|\theta|)SIN(\gamma)$

The waypoint radial and distance are calculated with the following formulas:

$$\text{Waypoint radial} = \omega+SGN(\beta)(\theta)+VAR$$

$$\text{Waypoint distance} = 60[SIN^{-1}[SIN(|\beta|)SIN(\gamma)]$$

Using Atari functions:

$$\text{Waypoint distance} = 60[TAN^{-1}[Y/(1-Y^2)^2]$$

Where $Y=SIN(|\beta|)SIN(\gamma)]$

TERMINAL WAYPOINTS

The terminal waypoints are calculated by letting the reference navaid be the "from" fix and the terminal airport be the "to" fix. The same formulas used to find the true course and distance are used. The reference navaid's magnetic variation is added to the bearing from the reference fix to the terminal airport to obtain the proper radial. The reference navaid's magnetic variation is also used to obtain the magnetic course from the departure airport or to the destination airport as the case may be.

This program converts calibrated airspeed (CAS) to mach number (M) and true airspeed (TAS). Inputs required are pressure altitude (PALT), aircraft recovery coefficient (C_T) and indicated air temperature (IAT). Values for recovery coefficient vary from 0.6 to 1.0, but 0.8 is a good value for most aircraft

The formulas used are less accurate for mach numbers above 1.0 (i.e., supersonic flight).

$$\text{Pressure ratio}\left(\frac{P}{P_o}\right) = \left[\frac{518.67 - 3.566 \times .10^{-3}\ \text{PALT}}{518.67}\right]^{5.2563}$$

$$M^2 = 5\left[\left(\frac{P_o}{P}\left\{\left[1 + 0.2\left(\frac{CAS}{661.5}\right)^2\right]^{3.5} - 1\right\} + 1\right)^{0.2857} - 1\right]$$

$$TAS = 38.96M\sqrt{(IAT + 273)\left[C_T\left(\frac{1}{(1 + 0.2\,M^2)} - 1\right) + 1\right]}$$

				SIZE: 008

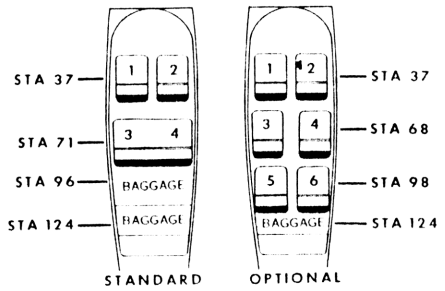
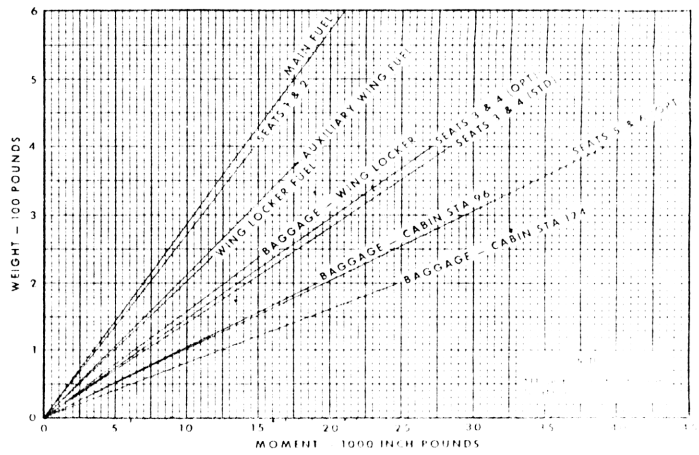
PASSENGER SEAT AND BAGGAGE BAY MOMENT ARMS



LOADING MOMENTS CHART



The following information is provided to enable a check of the aircraft load to determine if it falls within the approved center of gravity limits.

1) Determine weights, then obtain moments of useful load items from Loading Moments Chart, or multiply weight times CG arm.
2) Enter these weights and moments in the Loading Manifest Chart and total.
3) Enter the Center of Gravity Moment Envelope - Inch Pounds chart with the takeoff weight and center of gravity moment in inch pounds. If the intersection of these points falls within the envelope, the load is approved.
4) If desired, the Center of Gravity Moment Envelope - Inches chart may be used to determine whether the load is approved. CG arm is equal to the total moment divided by the total weight. Enter the chart with the takeoff weight and CG arm. If the intersection of these points fall within the envelope, the load is approved.

LOADING MANIFEST CHART

WINDS CORRECTION

W I N D C O R R E C T I O N H P - 4 1 C P R O G R A M

Note: All velocities are absolute values.

True Heading:

$$TH=TC+SIN^{-1}[Wv*SIN(Wd-TC)/TAS]$$

Wv=Wind Velocity
Wd=Wind Direction

Ground Speed:

$$GS=[(TAS*SIN(TH)-Wv*SIN(Wd))^2+(TAS*COS(TH)-Wv*COS(Wd))^2]^{1/2}$$

If COS(Wd-TH) is negative and TAS<Wv then the GS is negative.

Wind Direction:

$$Wd=TAN^{-1}[(TAS*SIN(TH)-GS*SIN(TC))/(TAS*COS(TH)-GS*COS(TC))]$$

If TAS*COS(TH)-GS*COS(TC) is negative then add 180 to the Wd.

Wind Velocity:

$$Wv=[(TAS*SIN(TH)-GS*SIN(TC))^2+(TAS*COS(TH)-GS*COS(TC))^2]^{1/2}$$

CURVE FITTING

CURVE FITTING

For a set of data points (x_i, y_i), i = 1, 2, ..., n, this program can be used to fit the data to any of the following curves:

1. Straight line (linear regression): $y = a + bx$.
2. Exponential curve: $y = ae^{bx}$ $(a > 0)$,
3. Logarithmic curve: $y = a + b \ln x$,
4. Power curve: $y = ax^b$ $(a > 0)$.

The regression coefficients a and b are found by solving the following equivalent system of linear equations.

$$An + B\Sigma X_i = \Sigma Y_i$$

$$A\Sigma X_i + B\Sigma X_i^2 = \Sigma Y_i X_i$$

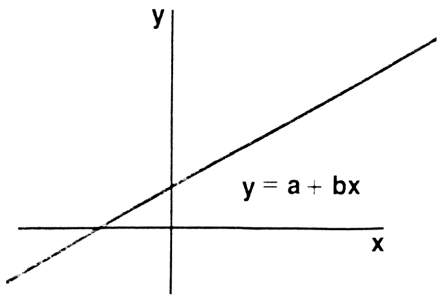
The relations of the variables are defined by the following:

Regression	A	B	X_i	Y_i
Linear	a	b	x_i	y_i
Exponential	ln a	b	x_i	$\ln y_i$
Logarithmic	a	b	$\ln x_i$	y_i
Power	ln a	b	$\ln x_i$	$\ln y_i$

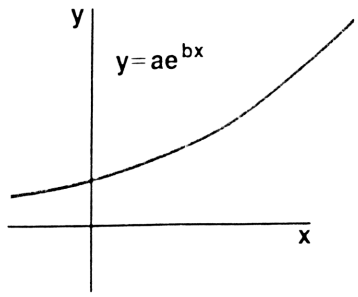
The coefficient of determination is:

$$R^2 = \frac{A\Sigma Y_i + b\Sigma X_i Y_i - \frac{1}{n}(\Sigma Y_i)^2}{\Sigma(Y_i^2) - \frac{1}{n}(\Sigma Y_i)^2}$$

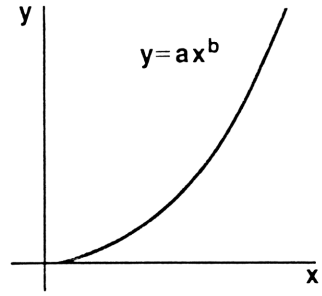
Linear Regression



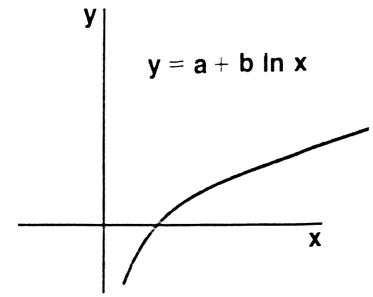
Exponential Curve Fit



Power Curve Fit



Logarithmic Curve Fit



Remarks:

1. The program applies the least square method, either to the original equations (straight line and logarithmic curve) or to the transformed equations (exponential curve and power curve).
2. Negative and zero values of x_i will cause a calculator error for logarithmic curve fits. Negative and zero values of y_i will cause a machine error for exponential curve fits. For power curve fits both x_i and y_i must be positive, non-zero values.
3. As the differences between x and/or y values become small, the accuracy of the regression coefficients will decrease.

				SIZE: 016
STEP	**INSTRUCTIONS**	**INPUT**	**FUNCTION**	**DISPLAY**
1	Set status and key in the program			
2	Initialize the program for STRAIGHT LINE or for EXPONENTIAL CURVE or for LOGARITHMIC CURVE or for POWER CURVE		 XEQ LIN XEQ EXP XEQ LOG XEQ POW	 LIN EXP LOG POW
3	Repeat step 3 and 4 for i=1,2,.... n input: x_i y_i	 x_i y_i	 ENTER↑ A	 (i)
4	If you made a mistake in inputting x_k and y_k, then correct by→	x_k y_k	ENTER↑ C	 (k−1)
5	Calculate R^2 and regression coefficients a and b		E R/S R/S	R2=(R^2) a=(a) b=(b)

STEP	INSTRUCTIONS	INPUT	FUNCTION	DISPLAY
6	Calculate estimated y from regression, input x	x	R/S	Y.= (ŷ)
7	Repeat step 6 for different x's			
8	Repeat step 5 if you want the results again			
9	To use the same program for another set of data, initialize the program by →		[shift] A	LIN or EXP or LOG or POW
	then go to step 3			
10	To use another program, go to step 2			

Example 1:

Fit a straight line to the following set of data and compute ŷ for x = 37 and x = 35.

x_i	40.5	38.6	37.9	36.2	35.1	34.6

23 R/S	***Y. = 2.52***	

Programming Highlight

This program uses a single section of code for most of the calculations it needs to do. Since each of the four types of curve fitting requires the input data to be in a different form, it would seem that a different program should be used for each curve type. Instead, each of the set-up programs, LIN, LOG, EXP, and POW, stores a code in register 00. Then the single function on line 32, XEQ IND 00, takes care of the four different ways of processing the input data by executing the function whose label is stored in register 00.

TRIGONOMETRY

TRIGONOMETRIC FUNCTIONS IN A RIGHT-ANGLED TRIANGLE

If A, B, and C are the vertices (C the right angle), and a, b, and h the sides opposite respectively,

$$\text{sine } A = \sin A = \frac{a}{h}, \qquad \text{cosine } A = \cos A = \frac{b}{h},$$

$$\text{tangent } A = \tan A = \frac{a}{b}, \qquad \text{cotangent } A = \cot A = \operatorname{ctn} A = \frac{b}{a},$$

$$\text{secant } A = \sec A = \frac{h}{b}, \qquad \text{cosecant } A = \csc A = \frac{h}{a}.$$

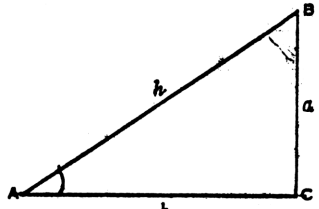

Fig. 4

$$\text{exsecant } A = \text{exsec } A = \sec A - 1$$

$$\text{versine } A = \text{vers } A = 1 - \cos A$$

$$\text{coversine } A = \text{covers } A = 1 - \sin A$$

$$\text{haversine } A = \text{hav } A = \tfrac{1}{2} \text{ vers } A$$

RELATIONS BETWEEN DEGREE OF ACCURACY OF COMPUTED LENGTHS AND ANGLES

When solving a triangle for any of its parts the following should be observed:

Length to:	(requires)	Angle to:
2 significant digits		nearest 30′ = 0.5°
3 significant digits		nearest 05′ = 0.083°
4 significant digits		nearest 01′ = 0.0167°
5 significant digits		nearest 0.1′ = 0.00167°

SIGNS AND LIMITS OF VALUE ASSUMED BY THE FUNCTIONS

Function	Quadrant I		Quadrant II		Quadrant III		Quadrant IV

EXPONENTIAL DEFINITIONS OF CIRCULAR FUNCTIONS

$$\sin x = \frac{1}{2i}(e^{ix} - e^{-ix}) \qquad \text{cosec } x = \frac{2i}{e^{ix} - e^{-ix}}$$

$$(i^2 = -1)$$

$$\cos x = \frac{e^{ix} + e^{-ix}}{2} \qquad \sec x = \frac{2}{e^{ix} + e^{-ix}}$$

$$\tan x = \frac{e^{ix} - e^{-ix}}{ie^{ix} + ie^{-ix}} \qquad \cot x = \frac{ie^{ix} + ie^{-ix}}{e^{ix} - e^{-ix}}$$

RELATIONS OF THE FUNCTIONS

$$\sin x = \frac{1}{\text{cosec } x}. \qquad \text{cosec } x = \frac{1}{\sin x}.$$

$$\cos x = \frac{1}{\sec x}. \qquad \sec x = \frac{1}{\cos x}.$$

$$\tan x = \frac{1}{\cot x} = \frac{\sin x}{\cos x}. \qquad \sin^2 x + \cos^2 x = 1.$$

$$\cot x = \frac{1}{\tan x} = \frac{\cos x}{\sin x}. \qquad 1 + \tan^2 x = \sec^2 x.$$

$$1 + \cot^2 x = \text{cosec}^2 x.$$

$$*\sin x = \pm\sqrt{1 - \cos^2 x}. \qquad *\cos x = \pm\sqrt{1 - \sin^2 x}.$$

$$*\tan x = \pm\sqrt{\sec^2 x - 1}. \qquad *\sec x = \pm\sqrt{\tan^2 x + 1}.$$

$$*\cot x = \pm\sqrt{\text{cosec}^2 x - 1}. \qquad *\text{cosec } x = \pm\sqrt{\cot^2 x + 1}.$$

$$\sin x = \cos(90° - x) = \sin(180° - x).$$

$$\cos x = \sin(90° - x) = -\cos(180° - x).$$

$$\tan x = \cot(90° - x) = -\tan(180° - x).$$

$$\cot x = \tan(90° - x) = -\cot(180° - x).$$

$$\text{cosec } x = \cot\frac{x}{2} - \cot x.$$

* The sign in front of radical depends on quadrant in which x falls.

FUNCTIONS OF SUMS OF ANGLES

$$\sin(x \pm y) = \sin x \cos y \pm \cos x \sin y.$$
$$\cos(x \pm y) = \cos x \cos y \mp \sin x \sin y.$$
$$\tan(x \pm y) = \frac{\tan x \pm \tan y}{1 \mp \tan x \tan y}.$$

FUNCTIONS OF MULTIPLE ANGLES

$$\sin 2x = 2 \sin x \cos x.$$
$$\cos 2x = \cos^2 x - \sin^2 x = 2\cos^2 x - 1 = 1 - 2\sin^2 x.$$
$$\sin 3x = 3 \sin x - 4 \sin^3 x.$$
$$\cos 3x = 4 \cos^3 x - 3 \cos x.$$
$$\sin 4x = 8 \cos^3 x \sin x - 4 \cos x \sin x.$$
$$\cos 4x = 8 \cos^4 x - 8 \cos^2 x + 1.$$
$$\sin 5x = 5 \sin x - 20 \sin^3 x + 16 \sin^5 x.$$
$$\cos 5x = 16 \cos^5 x - 20 \cos^3 x + 5 \cos x.$$
$$\sin 6x = 32 \cos^5 x \sin x - 32 \cos^3 x \sin x + 6 \cos x \sin x.$$
$$\cos 6x = 32 \cos^6 x - 48 \cos^4 x + 18 \cos^2 x - 1.$$
$$\tan 2x = \frac{2 \tan x}{1 - \tan^2 x}.$$
$$\cot 2x = \frac{\cot^2 x - 1}{2 \cot x}.$$
$$\tan 3x = \frac{3 \tan x - \tan^3 x}{1 - 3 \tan^2 x}.$$
$$*\sin \tfrac{1}{2}x = \pm \sqrt{\frac{1 - \cos x}{2}}.$$
$$*\cos \tfrac{1}{2}x = \pm \sqrt{\frac{1 + \cos x}{2}}.$$
$$*\tan \tfrac{1}{2}x = \pm \sqrt{\frac{1 - \cos x}{1 + \cos x}} = \frac{1 - \cos x}{\sin x} = \frac{\sin x}{1 + \cos x}.$$

* The sign in front of radical depends on quadrant in which x falls.

MISCELLANEOUS RELATIONS

$$\sin x \pm \sin y = 2 \sin \tfrac{1}{2}(x \pm y) \cdot \cos \tfrac{1}{2}(x \mp y).$$
$$\cos x + \cos y = 2 \cos \tfrac{1}{2}(x + y) \cdot \cos \tfrac{1}{2}(x - y).$$
$$\cos x - \cos y = -2 \sin \tfrac{1}{2}(x + y) \cdot \sin \tfrac{1}{2}(x - y).$$
$$\sin x \cos y = \tfrac{1}{2}[\sin(x + y) + \sin(x - y)]$$
$$\cos x \sin y = \tfrac{1}{2}[\sin(x + y) - \sin(x - y)]$$
$$\cos x \cos y = \tfrac{1}{2}[\cos(x + y) + \cos(x - y)]$$
$$\sin x \sin y = \tfrac{1}{2}[\cos(x - y) - \cos(x + y)]$$
$$\tan x \pm \tan y = \frac{\sin(x \pm y)}{\cos x \cdot \cos y}. \quad \cot x \pm \cot y = \frac{\pm \sin(x \pm y)}{\sin x \cdot \sin y}.$$
$$\frac{1 + \tan x}{1 - \tan x} = \tan(45° + x). \quad \frac{\cot x + 1}{\cot x - 1} = \cot(45° - x).$$
$$\frac{\sin x \pm \sin y}{\cos x + \cos y} = \tan \tfrac{1}{2}(x \pm y).$$
$$\frac{\sin x \pm \sin y}{\cos x - \cos y} = -\cot \tfrac{1}{2}(x \mp y).$$
$$\frac{\sin x + \sin y}{\sin x - \sin y} = \frac{\tan \tfrac{1}{2}(x + y)}{\tan \tfrac{1}{2}(x - y)}.$$
$$\sin^2 x - \sin^2 y = \sin(x + y) \cdot \sin(x - y).$$
$$\cos^2 x - \cos^2 y = -\sin(x + y) \sin(x - y).$$
$$\cos^2 x - \sin^2 y = \cos(x + y) \cos(x - y).$$

INVERSE TRIGONOMETRIC FUNCTIONS

The following table lists each of the six inverse trigonometric functions together with the interval of its principal value:

Function	Interval containing principal value	
	x positive or zero	x negative
$y = \sin^{-1} x$ and $\tan^{-1} x$	$0 \leqq y \leqq \pi/2$	$-\pi/2 \leqq y < 0$
$y = \cos^{-1} x$ and $\cot^{-1} x$	$0 \leqq y \leqq \pi/2$	$\pi/2 < y \leqq \pi$
$y = \sec^{-1} x$ and $\csc^{-1} x$	$0 \leqq y \leqq \pi/2$	$-\pi \leqq y \leqq -\pi/2$

Usually the first letter in "arc" or the name of the inverse trigonometric functions is capitalized if the principal value is desired. Thus

$$\text{Arc sin } \frac{1}{2} = \text{Sin}^{-1} \frac{1}{2} = \frac{\pi}{6},$$

while

$$\text{arc sin } \frac{1}{2} = \frac{\pi}{6} + 2\pi n \text{ or } \frac{5\pi}{6} + 2\pi n$$

In the calculus both for differentiation or integral formulas, capitalization is not adhered to strictly, but principal values are always understood for inverse trigonometric functions when used unless specifically stated otherwise.

RELATIONS BETWEEN SIDES AND ANGLES OF ANY PLANE TRIANGLE

In a triangle with angles A, B, and C and sides opposite a, b, and c respectively,

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = \text{diameter of the circumscribed circle.}$$

$$a^2 = b^2 + c^2 - 2bc\cos A.$$

$$a = b\cos C + c\cos B.$$

$$\cos A = \frac{b^2 + c^2 - a^2}{2bc}.$$

$$\tan\frac{A-B}{2} = \frac{a-b}{a+b}\cot\frac{C}{2}.$$

$$\sin A = \frac{2}{bc}\sqrt{s(s-a)(s-b)(s-c)},$$

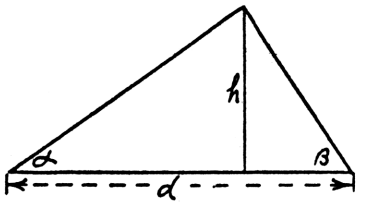
where $s = \frac{1}{2}(a+b+c)$ and $r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}$.

$$\sin\frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{bc}}.$$

$$\cos\frac{A}{2} = \sqrt{\frac{s(s-a)}{bc}}.$$

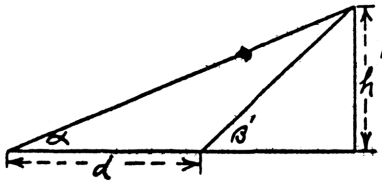
$$\tan\frac{A}{2} = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}} = \frac{r}{s-a}.$$

$$\frac{a+b}{a-b} = \frac{\sin A + \sin B}{\sin A - \sin B} = \frac{\tan\frac{1}{2}(A+B)}{\tan\frac{1}{2}(A-B)} = \frac{\cot\frac{1}{2}C}{\tan\frac{1}{2}(A-B)}.$$



$$h = d\frac{\sin\alpha\sin\beta}{\sin(\alpha+\beta)} = \frac{d}{\cot\alpha + \cot\beta}$$

Similarly



$$h = d\frac{\sin\alpha\sin\beta'}{\sin(\beta'-\alpha)} = \frac{d}{\cot\alpha - \cot\beta'}$$

Fig. 5

RELATIONS IN ANY SPHERICAL TRIANGLE

If A, B and C be the three angles and a, b, and c the opposite sides,

$$\frac{\sin A}{\sin a} = \frac{\sin B}{\sin b} = \frac{\sin C}{\sin c}.$$

$$\cos a = \cos b\cos c + \sin b\sin c\cos A = \frac{\cos b\cos(c \pm \theta)}{\cos\theta}$$

where $\tan\theta = \tan b\cos A$.

$$\cos A = -\cos B\cos C + \sin B\sin C\cos a.$$

$$\sin\tfrac{1}{2}A = \sqrt{\frac{\sin(s-b)\sin(s-c)}{\sin b\sin c}}$$

where $s = \frac{1}{2}(a+b+c)$.

$$\cos\tfrac{1}{2}A = \sqrt{\frac{\sin s\sin(s-a)}{\sin b\sin c}}.$$

$$\tan\tfrac{1}{2}A = \frac{r}{\sin(s-a)}$$

where $r = \sqrt{\frac{\sin(s-a)\sin(s-b)\sin(s-c)}{\sin s}}$

$$\cos\tfrac{1}{2}a = \sqrt{\frac{\cos(S-B)\cos(S-C)}{\sin B\sin C}}$$

where $S = \frac{1}{2}(A+B+C)$.

$$\sin\tfrac{1}{2}a = \sqrt{-\frac{\cos S\cos(S-A)}{\sin B\sin C}}.$$

$$\tan\tfrac{1}{2}a = R\cos(S-A)$$

where $R = \sqrt{\frac{-\cos S}{\cos(S-A)\cos(S-B)\cos(S-C)}}$.

$$\frac{\tan\frac{a+b}{2}}{\tan\frac{c}{2}} = \frac{\cos\frac{A-B}{2}}{\cos\frac{A+B}{2}}, \quad \frac{\tan\frac{A+B}{2}}{\cot\frac{C}{2}} = \frac{\cos\frac{a-b}{2}}{\cos\frac{a+b}{2}}.$$

$$\frac{\tan\frac{a-b}{2}}{\tan\frac{c}{2}} = \frac{\sin\frac{A-B}{2}}{\sin\frac{A+B}{2}}, \quad \frac{\tan\frac{A-B}{2}}{\cot\frac{C}{2}} = \frac{\sin\frac{a-b}{2}}{\sin\frac{a+b}{2}}.$$

$$\text{hav}\,a = \text{hav}(b-c) + \sin b\sin c\,\text{hav}\,A$$

$$\text{hav}\,A = \frac{\sqrt{\text{hav}[a+(b-c)]\,\text{hav}[a-(b-c)]}}{\sin b\sin c}$$

TRANSFORMATION OF COORDINATES

Rectangular System

(1) Translation only of axes parallel to themselves.
The coordinates of new origin with respect to old axes: $x = h$, $y = k$. Primed letters designate new coordinates.

$$x' = x - h \qquad x = x' + h$$
$$y' = y - k \qquad y = y' + k$$

(2) Rotation of axes with fixed origin.

Angle of rotation $= \theta$

$$x' = x\cos\theta + y\sin\theta \qquad x = x'\cos\theta - y'\sin\theta$$
$$y' = y\cos\theta - x\sin\theta \qquad y = y'\cos\theta + x'\sin\theta$$

(3) Origin translated and axes rotated.
Symbols same as above

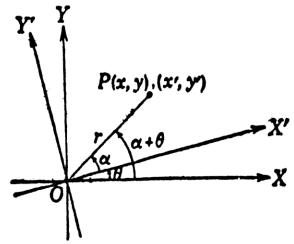
$$x' = (x - h)\cos\theta + (y - k)\sin\theta$$
$$y' = (y - k)\cos\theta - (x - h)\sin\theta$$
$$x = x'\cos\theta - y'\sin\theta + h$$
$$y = y'\cos\theta + x'\sin\theta + k$$

Relation between Rectangular and Polar Coordinates

$$x = r\cos\theta \qquad r = \sqrt{x^2 + y^2} \qquad \sin\theta = \frac{y}{\sqrt{x^2 + y^2}}$$
$$y = r\sin\theta \qquad \theta = \tan^{-1}\frac{y}{x} \qquad \cos\theta = \frac{x}{\sqrt{x^2 + y^2}}$$

Rotation of Polar Axes through Angle θ

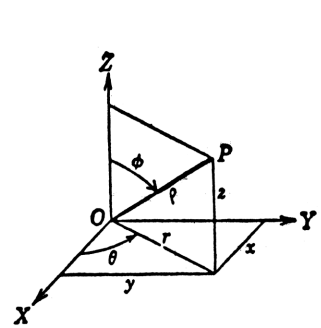
$$x' = r\cos\alpha$$
$$y' = r\sin\alpha$$
$$x = r\cos(\alpha + \theta)$$
$$y = r\sin(\alpha + \theta)$$

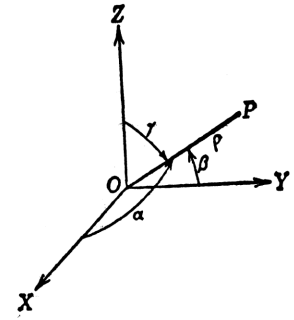


TRANSFORMATION OF COORDINATES (Continued)
SOLID ANALYTICAL GEOMETRY

Space Coordinates

1. Rectangular System x, y, z.
2. Cylindrical System r, θ, z.
3. Spherical System ρ, θ, ϕ. In certain situations it is desirable to interchange the symbols ϕ for θ and vice versa.
4. Polar Space System $\rho, \alpha, \beta, \gamma$.





Relations of Coordinates of Systems in Terms of x, y, z

Cylindrical	Spherical	Polar Space
$r = \sqrt{x^2 + y^2}$	$\rho = \sqrt{x^2 + y^2 + z^2}$	$\rho = \sqrt{x^2 + y^2 + z^2}$
$\theta = \tan^{-1}\frac{y}{x}$	$\theta = \tan^{-1}\frac{y}{x}$	$\alpha = \cos^{-1}\left(\frac{x}{\sqrt{x^2 + y^2 + z^2}}\right)$
$z = z$	$\phi = \cos^{-1}\left(\frac{z}{\sqrt{x^2 + y^2 + z^2}}\right)$	$\beta = \cos^{-1}\left(\frac{y}{\sqrt{x^2 + y^2 + z^2}}\right)$
		$\gamma = \cos^{-1}\left(\frac{z}{\sqrt{x^2 + y^2 + z^2}}\right)$

Relations of Rectangular Coordinates (x, y, z) in Terms of Cylindrical, Spherical and Polar Space Coordinates

Cylindrical	Spherical	Polar Space
$x = r\cos\theta$ $y = r\sin\theta$ $z = z$	$x = \rho\sin\phi\cos\theta$ $y = \rho\sin\phi\sin\theta$ $z = \rho\cos\phi$	$x = \rho\cos\alpha$ $y = \rho\cos\beta$ $z = \rho\cos\gamma$
