INTRODUCTION

Programs for your HP-65 Math Pac 2 have been selected from the areas of number theory, complex analysis, numerical analysis and miscellaneous higher functions.

Each program includes a general description, formulas used in the program solution, numerical examples, and user instructions. Program listings and register allocations are given in the back of the Pac.

Some related individual programs were combined on one card when it seemed they might be useful together. In this way more programs could be included in the Pac.

We hope you find the HP-65 Math Pac 2 a useful tool for your computational work, and welcome your comments, requests and suggestions—these are our most important source of future user-oriented programs.

4 Format of User Instructions

FORMAT OF USER INSTRUCTIONS

The following is an example of a set of User Instructions.

| LINE | INSTRUCTIONS | DATA | KEYS | DISPLAY |
|------|---------------------------------|-------|------|---------|
| 1 | Enter program | | | |
| 2 | Clear registers | | A | |
| 3 | Perform 3–4 for $i=1, \dots, n$ | a_i | ↑ | |
| 4 | | b_i | B | |
| 5 | | | C | Answer |
| | (To run a new case, go to 2) | | | |

To follow the instructions, start with line 1 and read from left to right, performing indicated operations as you proceed. Lines having no numbers contain special notes to the user and are inside parentheses in the INSTRUCTIONS column. The message “To run a new case, go to 2” following line 5 in the above example is a special note.

Lines are read in sequential order except where the INSTRUCTIONS column directs otherwise. For example, “go to 2” means to jump to line 2. Repeated processes—used in most cases for a long string of input/output data—are outlined with a bold border together with a “Perform” instruction. In the above example, “Perform 3–4 for $i = 1, \dots, n$ ” means to execute the loop (line 3 and line 4) n times. The first time, the dummy variable i takes the value 1; the second time i takes the value 2; etc.

Normally, as in the above example, the first instruction is “Enter program” which means load the preprogrammed magnetic card (for instructions of loading a card, see “Entering A Program” on P. 7). Some instructions are self-contained and can be carried out by just reading the INSTRUCTIONS column alone, e.g., “Enter program”. But some instructions depend on the information supplied by the DATA and/or KEYS columns. In line 2 of the example above, “Clear registers” appears in the INSTRUCTIONS column and **A** appears in the KEYS column, which means you have to clear the working registers by pressing the **A** key.

The DATA column specifies the input data to be supplied. Invalid arguments which result in division by zero, finding square root of a negative number, etc. will result in flashing zeros. Arguments out of the designated program range will result in incorrect answers or flashing zeros. When a computed value exceeds the calculator range, an overflow or underflow occurs and halts the program.

The KEYS column specifies the keys to be pressed. **↑** is the symbol used to denote the **ENTER♦** key. All other key designations are identical to those appearing on the HP-65. Ignore any blank positions in the KEYS column.

The DISPLAY column may show counters, intermediate or final results. In line 5 of the example, the answer will be displayed after pressing the **C** key.

ENTERING A PROGRAM

From the card case supplied with this application pac, select a program card.

Set W/PRGM-RUN switch to RUN.

Turn the calculator ON. You should see 0.00

Gently insert the card (printed side up) in the right, lower slot as shown. When the card is part way in, the motor engages it and passes it out the left side of the calculator. Sometimes the motor engages but does not pull the card in. If this happens, push the card a little farther into the machine. Do not impede or force the card; let it move freely. (The display will flash if the card reads improperly. In this case, press **CLX** and reinser the card.)

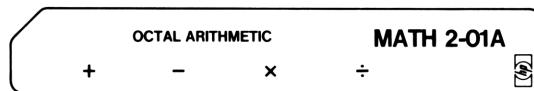

When the motor stops, remove the card from the left side of the calculator and insert it in the upper "window slot" on the right side of the calculator.

The program is now stored in the calculator. It remains stored until another program is entered or the calculator is turned off.

OCTAL ARITHMETIC

Given octal integers x , y , this program computes

$$y_8 \circ x_8$$

where operation \circ can be $+$, $-$, \times or \div .

Examples:

1. $213_8 + 37507_8 = 37722_8$
2. $12_8 - 37_8 = -25_8$
3. $12345_8 \times 4567_8 = 61341563_8$
4. $16_8 \div 4_8 = 3.40_8$

Note: This program will accept non-octal input arguments containing the digits 8 or 9. A number such as 981_8 will be treated the same as 1201_8 ($8_8 = 10_8$, $9_8 = 11_8$).

| 3 | | x | A | |
| 4 | Subtract | y | \uparrow | |
| 5 | | x | B | |
| 6 | Multiply | y | \uparrow | |
| 7 | | x | C | |
| 8 | Divide | y | \uparrow | |
| 9 | | x | D | |

INTEGER BASE CONVERSION

INTEGER BASE CONVERSION

MATH 2-02A

This program can be used to convert an integer n in base B_1 to an equivalent integer in base B_2 , where B_1, B_2 are integers such that $2 \leq B_i \leq 10$ ($i = 1, 2$).

n is first converted to a decimal integer then the decimal integer is converted to an integer in base B_2 .

- Notes:**
1. A non-integer entry is truncated to an integer which then is converted to its equivalent integer in the specified base.
 2. This program will accept “invalid” input arguments; e.g., 981_8 will be treated the same as 1201_8 ($8_8 = 10_8$, $9_8 = 11_8$).

Examples:

1. $110_2 = 6_8$
2. $346_{10} = 2341_5$

BASE CONVERSION

BASE CONVERSION

MATH 2-03A

This program converts a positive decimal number Q to its equivalent number R in base a ($Q_{10} \rightarrow R_a$), or converts a positive number R in base a to a decimal number Q ($R_a \rightarrow Q_{10}$).

The base a can be any integer such that $2 \leq a \leq 99$.

A number such as $4B6_{16}$ cannot be represented directly on the display because the display is strictly numeric. Therefore, some convention must be adopted to represent numbers R_a when $a > 10$. We use the convention of allocating two digit locations for each single character in R_a when $a > 10$.

For example, $4B6_{16}$ is represented as 041106_{16} by our convention (in hexadecimal system, A = 10, B = 11, C = 12, D = 13, E = 14, F = 15).

When displayed, this number may appear as 41106 or with an exponent

4.1106 04

which is interpreted as $4.B6 \times 16^2$.

The displayed exponent 4 is in base 10 and only serves to locate the decimal point (in the same manner as for decimal numbers).

When base $a > 10$ (as in the above example), divide the displayed exponent by 2 to get the true exponent of the number. When the displayed exponent is an odd integer, shift the decimal point of the displayed number one place (to the left or right) and adjust its exponent accordingly to make the true exponent an integer.

For example, the displayed number

1.112 -03

is interpreted as $B.C \times 16^{-2}$ or $0.BC \times 16^{-1}$.

- Notes:**
- When the magnitude of the number is very large or very small, it takes a long time to execute this program. For integer (with base $a < 10$), use *Math 2–02A, Integer Base Conversion*.
 - This program will accept “invalid” input arguments; e.g., 981_8 will be treated the same as 1201_8 ($8_8 = 10_8$, $9_8 = 11_8$).

Examples:

1. $0.2937_{10} = 0.226277543_8$

(Press **DSP** **•** **9** to see the number)

2. $1.23_{10} \times 10^{-12} = 1.5A36A_{16} \times 16^{-10}$

(After pressing **DSP** **9**, display shows $1.051003061-20$)

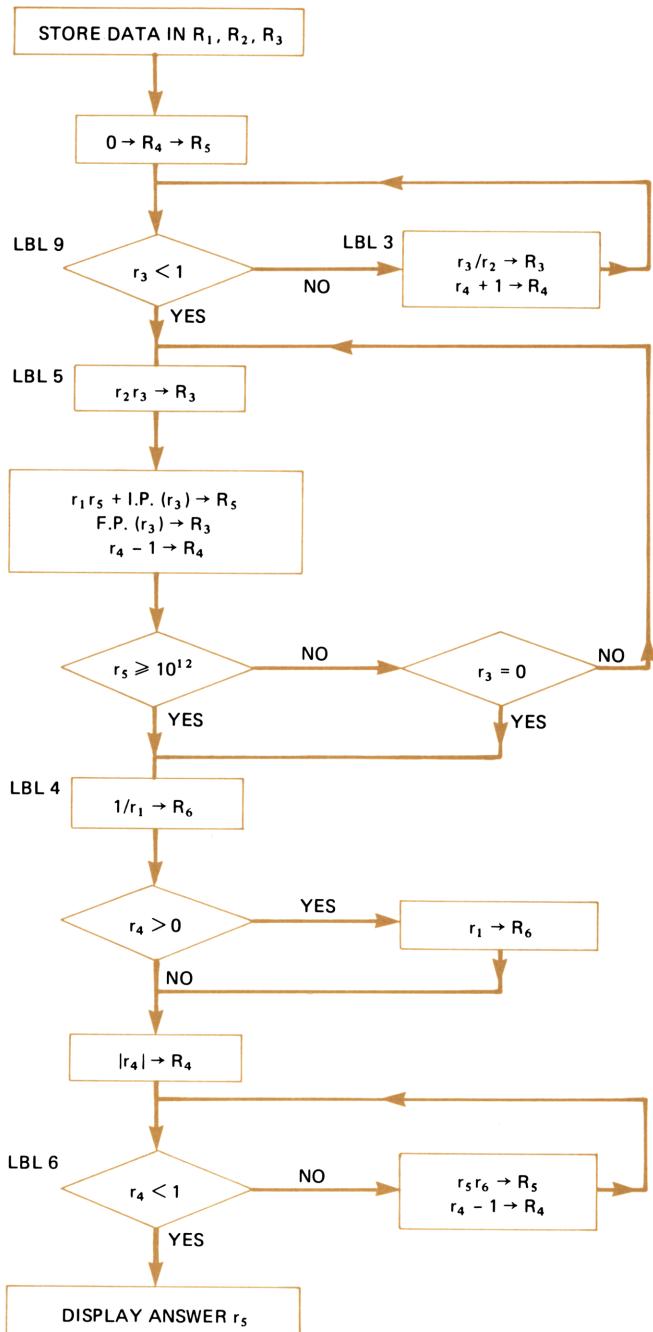

3. $7.200067_8 \times 8^{-10} = 6.752284070_{10} \times 10^{-9}$

(Press 7.200067 **EEX** **CHS** 10 to enter the number $7.200067_8 \times 8^{-10}$ in the calculator.)

4. $D.2EE4_{16} \times 16^{12} = 3.710731485_{10} \times 10^{15}$

(Press 13.02141404 **EEX** 24 to enter the number $D.2EE4_{16} \times 16^{12}$.)

COMPLEX FUNCTIONS $|z|$, z^2 , \sqrt{z} , $\frac{1}{z}$ 

Suppose $z = x + iy$, then

$$|z| = \sqrt{x^2 + y^2}$$

$$z^2 = (x^2 - y^2) + i(2xy)$$

$$\sqrt{z} = \begin{cases} \pm \sqrt{x} i & \text{if } y = 0 \text{ and } x < 0 \\ \pm \left[\sqrt{\frac{x+r}{2}} + i \frac{y}{2\sqrt{\frac{x+r}{2}}} \right] & \text{otherwise} \end{cases}$$

$$\frac{1}{z} = \frac{x}{r^2} - i \frac{y}{r^2} \quad (z \neq 0)$$

$$\text{where } r = \sqrt{x^2 + y^2}$$

Notation: Let $a + ib$ be the answer.

Examples:

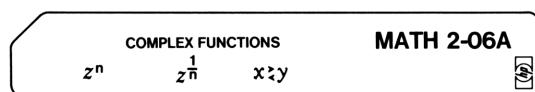

1. $|3 + 4i| = 5.00$

2. $(7 - 2i)^2 = 45.00 - 28.00i$

3. $\sqrt{7 + 6i} = \pm(2.85 + 1.05i)$

COMPLEX FUNCTIONS $z^n, z^{1/n}$ 

Suppose $z = x + iy = re^{i\theta}$ then

$$z^n = r^n e^{in\theta} = r^n (\cos n\theta + i \sin n\theta) = a + ib$$

$$z^{\frac{1}{n}} = r^{\frac{1}{n}} \left(\cos \frac{\theta + 360k}{n} + i \sin \frac{\theta + 360k}{n} \right) = x_k + iy_k$$

where θ is in degrees

n is a positive integer

and $k = 0, 1, \dots, n - 1$.

Restriction: $z \neq 0$

Examples:

1. $(3 + 4.5i)^5 = 926.44 - 4533.47i$

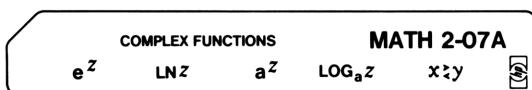

2. $5 + 3i$ has three cube roots:

$$x_0 + iy_0 = 1.77 + 0.32i$$

$$x_1 + iy_1 = -1.16 + 1.37i$$

$$x_2 + iy_2 = -0.61 - 1.69i$$

Given a polynomial (with complex coefficients) of the form

$$f(z) = c_0 z^n + c_1 z^{n-1} + \dots + c_{n-1} z + c_n$$

this program evaluates $f(z_0) = a + ib$ for any complex number z_0

where $c_k = a_k + ib_k \quad k = 0, 1, 2, \dots, n$

$$z_0 = x_0 + iy_0$$

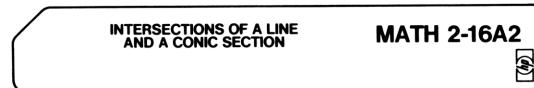

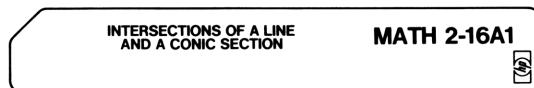

Example:

$$f(z) = (3 + 4i)z^4 + 18z^3 + (-2 + i)z^2 - 10z + (5 - 7i)$$

For $z_0 = 2 + i$

$$f(z_0) = -106.00 + 220.00i$$

INTERSECTIONS OF A LINE AND A CONIC SECTION

The program finds the intersections $(x_1, y_1), (x_2, y_2)$ of

$$\begin{cases} ax + by + c = 0 \\ Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \end{cases}$$

$$x_1 = -(by_1 + c)/a \quad (\text{if } a \neq 0)$$

$$y_1 = \frac{-\beta + \sqrt{\beta^2 - 4\alpha\gamma}}{2\alpha}$$

$$x_2 = -(by_2 + c)/a$$

$$y_2 = \frac{-\beta - \sqrt{\beta^2 - 4\alpha\gamma}}{2\alpha}$$

where

$$\alpha = \frac{Ab^2}{a^2} - \frac{Bb}{a} + C$$

$$\beta = \frac{2Abc}{a^2} - \frac{Bc}{a} - \frac{Db}{a} + E$$

$$\gamma = \frac{Ac^2}{a^2} - \frac{Dc}{a} + F$$

- Notes:**
1. This program also handles the case when $a = 0$ (and $b \neq 0$). It solves the problem by interchanging the roles of x and y .
 2. If $Q = \beta^2 - 4\alpha\gamma < 0$ there are no real solutions; display will show all 9's.
 3. If there is only one intersection, display will show flashing zeros. This program will not find the intersection in this case.

BESSEL FUNCTION $J_n(x)$ BESSEL FUNCTION $J_n(x)$ $J_n(x)$ **MATH 2-21A**

This program computes the value of the Bessel function $J_n(x)$ by using a numerical method which makes use of the recurrence relation

$$J_{n-1}(x) = \frac{2n}{x} J_n(x) - J_{n+1}(x)$$

the summation relation

$$J_0(x) + 2 \sum_{i=1}^{\infty} J_{2i}(x) = 1$$

and the fact that

$$\lim_{n \rightarrow \infty} J_n(x) = 0$$

First let

$$m = \text{INT} \left\{ 1 + 3x^{\frac{1}{12}} + 9x^{\frac{1}{3}} + \max(n, x) \right\}$$

where INT means “integer part of”.

Then set

$$T_m = a \quad T_{m+1} = 0$$

where a is an arbitrary non-zero constant.

Then the series of terms, T_k , $0 \leq k \leq m$, is computed by successively applying the relation

$$T_{k-1}(x) = \frac{2k}{x} T_k(x) - T_{k+1}(x)$$

starting with $k = m$.

$J_n(x)$ is then found by dividing the term $T_n(x)$ by the normalizing constant

$$K = T_0(x) + 2 \sum_{i=1}^p T_{2i}(x)$$

where

$$p = \begin{cases} \frac{m}{2} & \text{if } m \text{ is even} \\ \frac{m - 1}{2} & \text{if } m \text{ is odd} \end{cases}$$

Note that all the T_k are proportional to a , hence K and the result are independent of a .

Note: $J_0(x) = 1$ for $x \leq 10^{-6}$ but it is out of range for this program.

Examples:

1. $J_0(4.7) = -0.27$

2. $J_5(9.2) = -0.10$

KELVIN FUNCTIONS

KELVIN FUNCTIONS

MATH 2-22A

$$\text{ber}(x) = 1 - \frac{\left(\frac{1}{4}x^2\right)^2}{(2!)^2} + \frac{\left(\frac{1}{4}x^2\right)^4}{(4!)^2} - \dots$$

$$\text{bei}(x) = \frac{1}{4}x^2 - \frac{\left(\frac{1}{4}x^2\right)^3}{(3!)^2} + \frac{\left(\frac{1}{4}x^2\right)^5}{(5!)^2} - \dots$$

This program computes successive partial sums of the series. The program stops and displays the last partial sum as the answer, when two consecutive partial sums are equal or more than 50 terms have been added.

- Notes:**
1. When x is too large, computing a new term of the series might cause an overflow, in that case, display shows all 9's and the program stops.
 2. $\text{ber}(-x) = \text{ber}(x)$, $\text{bei}(-x) = \text{bei}(x)$

EULER ϕ FUNCTIONEULER ϕ FUNCTION $\phi(n)$ **MATH 2-23A**

$\Phi(n)$ is the number of integers not exceeding and relatively prime to n , where n is a non-negative integer.

Suppose

$$n = p_1^{m_1} p_2^{m_2} \dots p_k^{m_k}$$

where p_i ($i = 1, 2, \dots, k$) are distinct primes dividing n , then

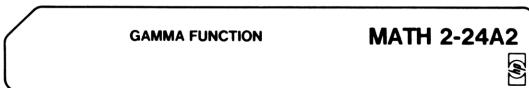

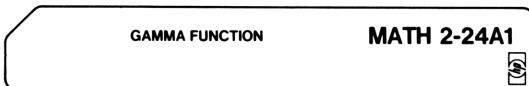

$$\begin{aligned}\Phi(n) &= n \prod_{i=1}^k \left(1 - \frac{1}{p_i}\right) \\ &= \prod_{i=1}^k (p_i^{m_i} - p_i^{m_i-1})\end{aligned}$$

Examples:

1. $\Phi(30) = 8.00$

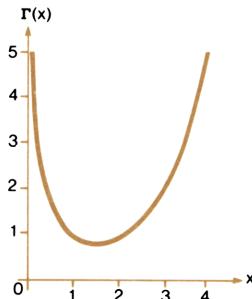

2. $\Phi(251) = 250.00$

GAMMA FUNCTION

This program approximates the value of gamma function $\Gamma(x)$ for $1 \leq x < 70$.

$$\Gamma(x) = \int_0^{\infty} t^{x-1} e^{-t} dt$$

1. $\Gamma(x) = (x - 1) \Gamma(x - 1)$
2. For $1 \leq x \leq 2$, polynomial approximation can be used.

$$\Gamma(x) \cong 1 + b_1(x - 1) + b_2(x - 1)^2 + \dots + b_8(x - 1)^8$$

where $b_1 = -0.577191652$, $b_2 = 0.988205891$
 $b_3 = -0.897056937$, $b_4 = 0.918206857$
 $b_5 = -0.756704078$, $b_6 = 0.482199394$
 $b_7 = -0.193527818$, $b_8 = 0.035868343$

Note: This program can be used to find the generalized factorial $x!$ for $0 \leq x < 69$.

$$x! = \Gamma(x + 1)$$

Examples:

1. $\Gamma(5.25) = 35.21$
2. $7! = \Gamma(8) = 5040.00$
3. $2.34! = \Gamma(3.34) = 2.80$

INCOMPLETE GAMMA FUNCTION

INCOMPLETE GAMMA FUNCTION

 $\gamma(a, x)$ **MATH 2-25A**

$$\gamma(a, x) = \int_0^x e^{-t} t^{a-1} dt$$

$$= x^a e^{-x} \sum_{n=0}^{\infty} \frac{x^n}{a(a+1)\dots(a+n)}$$

where $a > 0, x > 0$.

This program computes successive partial sums of the series. The program stops when two consecutive partial sums are equal, and displays the last partial sum as the answer.

Note: When x is too large, computing a new term of the series might cause an overflow. In that case, display shows all 9's and the program stops.

Examples:

1. $\gamma(1, 2) = 0.86$

2. $\gamma(1, 0.1) = 0.10$

GAUSSIAN HYPERGEOMETRIC FUNCTION

$$F(a, b; c; x) = F(b, a; c; x)$$

$$= \sum_{k=0}^{\infty} \frac{(a)_k (b)_k x^k}{(c)_k k!}$$

where $|x| < 1$.

The series is not defined if $c = -m$ ($m = 0, 1, 2, \dots$) except when a or b is equal to $-l$ ($l = 0, 1, 2, \dots$) with $l < m$.

This program computes successive partial sums of the series. The program stops when two consecutive partial sums are equal, and displays the last partial sum as the answer.

Notation: $(d)_0 = 1$

$$(d)_k = d (d+1) (d+2) \dots (d+k-1)$$

where $d = a, b, \text{ or } c$

Some special cases are:

$$1. F\left(-n, n; \frac{1}{2}; x\right) = T_n(1 - 2x)$$

$$2. F(-n, n+1; 1; x) = P_n(1 - 2x)$$

$$3. F\left(-n, n+2\alpha; \alpha+\frac{1}{2}; x\right) = \frac{n!}{(2\alpha)_n} C_n(\alpha) (1 - 2x)$$

$$4. F(-n, \alpha+1+\beta+n; \alpha+1; x) = \frac{n!}{(\alpha+1)_n} P_n(\alpha, \beta) (1 - 2x)$$

where $T_n, P_n, C_n(\alpha), P_n(\alpha, \beta)$ denote Chebyshev, Legendre's, Gegenbauer's and Jacobi's polynomials respectively.

Note: Displayed flashing zeros indicate that

1. The series is undefined for the set of input arguments.
or
2. The program has not found the sum of the series to desired accuracy after the first 400 terms have been added. This is likely to occur when $|x|$ is near 1 (the series converges slowly in that region).

$$F(1, 1; 2; 0.3) = 1.19$$

COMPLETE ELLIPTIC INTEGRALS

COMPLETE ELLIPTIC INTEGRALS
CEI

MATH 2-37A

The generalized complete elliptic integral of the second kind is defined as

$$\text{CEI}(k; A, B) = \int_0^{\pi/2} \frac{A + (B - A) \sin^2 t}{\sqrt{1 - k^2 \sin^2 t}} dt \quad (0 \leq k < 1)$$

To evaluate the integral, let

$$u_0 = 1, v_0 = \sqrt{1 - k^2}, a_0 = A, b_0 = B$$

be the starting values. Compute the sequences of numbers

$$u_{i+1} = u_i + v_i$$

$$v_{i+1} = 2 \sqrt{u_i v_i}$$

$$a_{i+1} = a_i + \frac{b_i}{u_i}$$

$$b_{i+1} = 2(a_i v_i + b_i)$$

The process is stopped at the n^{th} step such that

$$u_{n-1} (1 - 10^{-9}) \leq v_{n-1}$$

Then the integral is computed by

$$\text{CEI}(k; A, B) = \frac{\pi}{4} \frac{a_{n+1}}{u_n}$$

Some important special cases are:

1. $A = 1, B = 1$

Complete elliptic integral of the first kind

$$K(k) = \int_0^{\pi/2} \frac{dt}{\sqrt{1 - k^2 \sin^2 t}}$$

2. $A = 1, B = 0$

$$B(k) = \int_0^{\pi/2} \frac{1 - \sin^2 t}{\sqrt{1 - k^2 \sin^2 t}} dt$$

3. $A = 0, B = 1$

$$D(k) = \int_0^{\pi/2} \frac{\sin^2 t}{\sqrt{1 - k^2 \sin^2 t}} dt$$

Note: Special values are displayed for invalid arguments:

1. If $k^2 > 1$, display = 10^{99}

2. If $k^2 = 1$

$$\text{display} = \begin{cases} 10^{99} & \text{if } B > 0 \\ -10^{99} & \text{if } B < 0 \\ A & \text{if } B = 0 \end{cases}$$
