ESTIMATION OF A CONTACT'S COURSE, SPEED AND POSITION BASED ON BEARINGS-ONLY INFORMATION FROM TWO MOVING SENSORS WITH A PROGRAM FOR AN HP-67/97 CALCULATOR

by

R. H. Shudde Naval Postgraduate School Monterey, Ca. 93940

### ABSTRACT

This report provides a procedure for estimating a contact's course, speed and position based on bearings-only data from two moving sensors. This report also contains a program for the HP-67/97 calculator to implement the procedure.

KEYWORDS :

Tracking Programmable Calculator ASW Tactical Analysis Calculator Moving Sensors

The programs in this report are for use within the Department of the Navy, and they are presented without representation or warranty of any kind.

### TABLE OF CONTENTS

### A. Problem Statement

Bearings-only data for a single target from two sensors which may be moving or stationary are available at two distinct times. The following quantities are required: an estimate of course, speed and position of the target at the latest time; an estimate of a future position of the target and/or an estimate of a point on the track of the target with a specified lead distance at a future time. The relative positions of the two sensors are assumed to be known at the time of each target bearing determination.

### B. Operational Analysis

Two simultaneous bearings from two sensors at two distinct times and with known relative positions are used to estimate the course and speed of a target. The HP-67/97 program presented here was designed so that the data corresponding to the earliest time point is purged if data corresponding to a third time point is introduced. The relative position of the sensors may be updated when required. Thus the estimated target position, course and speed are continually updated as new information becomes available. No course smoothing is performed.

 $\mathbf{1}$ 

- C. Computational Algorithm
- 1. Enter the course  $\psi_{\mathbf{e}}$  and speed  $V_{\mathbf{e}}$  of the primary sensor  $s,$
- 2. Enter the bearing  $\phi$  and range  $\rho$  of the secondary sensor  $S_2$  from the primary sensor  $S_1$  at the time of the latest bearing observation.
- 3. Enter the time  $t_1$ , the bearing of the target from  $s_1$ , and the bearing of the target from  $s_2$ . Output the target range from  $S_1$ .
- 4. Repeat Step 3 or Steps 2 and 3 for a second time  $t_2 > t_1$ .
- 5. Compute and output:
	- a. The estimated course and speed of the target.
	- b. The bearing and range  $(n.mi.)$  of the target from  $S_1$ at time  $t_2$ .
	- c. The bearing and range  $(n.mi.)$  of the target from  $S_2$ at time  $t_2$ .
- 6. If required, enter a time  $t_{\ell}$  >  $t_2$  at which a lead distance £ (n.mi.) is required. Then compute and output the target's predicted bearing and range from both  $S_1$  and  $S_2$ .
- 7. Repeat from Steps 1, 2, 3 or 4 as required.

### 1. User Instructions

\* Note: The (R/S) function is required when using the HP-67 mode. This output is automatically printed on the HP-97.

### 2. Sample Problem

- a. The Primary Sensor  $S_1$  is traveling on a course of 210° at 10 knots.
- b. At the time of the first contact sensor,  $S_2$  is 115° and  $3.5$  n.mi. from  $S_1$ .
- c. At 1200 hours the first contact is at 245° from  $S_1$  and 260° from  $S_2$ . How far is the contact from  $S_1$  and  $S_2$ ? (Ans.: 8 n.mi. from  $S_1$  and 10 n.mi. from  $S_2$ .)
- d. At the next time mark sensor  $S_2$  is 100° and 5.0 n.mi. from  $s_{1}$ .
- e. This next time mark is at 1230 hours with the contact at 160° from  $S_1$  and 239° from  $S_2$ .
- Estimate the course and speed of the contact. (Ans.: 126° and 14 knots.)
- g. What is the bearing and range of the contact from S<sub>1</sub> at 1230 hours? (Ans.: 160° and 3 n.mi.) From  $S_2$ ? (Ans.: 239° and 4 n.mi.)
- h. Estimate the bearing and range of the contact from  $S_1$  and  $s<sub>2</sub>$  at 1245 hours with a lead distance of 3.5 n.mi.  $(S_1 \text{ Ans.}: 137^\circ \text{ and } 10 \text{ n.mi.})$  $(S_2 \text{ Ans.}: 164^{\circ} \text{ and } 7 \text{ n.mi.})$

### E. Geometric Analysis

### 1. Static Geometry

Let  $\bar{R}_i = (\theta_{1i}, R_i)$  denote the bearing and range of the target from the reference (primary) sensor  $s_1$  at time  $t_i$ , and let  $\vec{r}_i$  = ( $\theta_{2i}$ , $r_i$ ) denote the bearing and range of the target from the secondary sensor  $S_2$  at time  $t_i$ , i = 1,2, where  $t_1 < t_2$ . Let  $\phi_i = (\phi_i, \rho_i)$  denote the bearing and range of S<sub>2</sub> from S<sub>1</sub> at time  $t_i$ . The static geometry for some fixed time  $t_i$  is depicted in Figure 1.

From Figure 1 we see that

$$
\vec{\mathbf{R}}_{i} = \vec{\rho}_{i} + \vec{\mathbf{r}}_{i} . \qquad (1)
$$

By equating the rectangular components of Equation (1) we have

$$
R_{i} \cos \theta_{1i} = \rho \cos \phi + r_{i} \cos \theta_{2i}
$$
 (2a)

and

$$
R_{i} \sin \theta_{1i} = \rho \sin \phi + r_{i} \sin \theta_{2i} . \qquad (2b)
$$

Equations (2) are two equations in the two unknown ranges  $R_i$ and  $r_i$ . Solving this system of equations we obtain

$$
R_{i} = \rho_{i} \frac{\sin(\theta_{2i} - \phi_{i})}{\sin(\theta_{2i} - \theta_{i1})}
$$
 for any i, (3)

and

FIGURE 1. The Relative Sensor and Target Geometry at Time  $t_i$ .

$$
r_{i} = \rho_{i} \frac{\sin(\theta_{1i} - \phi_{i})}{\sin(\theta_{2i} - \theta_{1i})}
$$
 for any i. (4)

At any time  $t_i$  the target range  $R_i$  from sensor  $S_i$  and the target range  $r_i$  from sensor  $s_2$  may be computed from Equations (3) and (4), respectively. Thus  $\bar{R}_i$  and  $\bar{r}_i$  are determined at any time  $t_i$ .

### 2. Dynamic Geometry

Let  $\vec{v}_g = (\psi_g, V_g)$  denote the course and speed of the primary sensor S,, and let  $\vec{V}_{-}$  = ( $\psi_{-}$ , V<sub>r</sub>) denote the unknown Let  $V_g = (W_g, V_g)$  denote the course and speed of the<br>primary sensor  $S_1$ , and let  $\vec{V}_T = (\Psi_T, V_T)$  denote the unknown<br>course and speed of the target. Let  $\Delta t = t_a - t, > 0$  be the time between first and second observations of the target. The absolute motion of sensors and the target is depicted in Figure 2. From Piqure 2 it is evident that one of the many vectorial relationships is

$$
\vec{\hat{R}}_1 + \vec{v}_{T} \Delta t = \vec{v}_{g} \Delta t + \vec{R}_2 . \qquad (5)
$$

The target course and speed vector  $\bar{\mathbf{v}}_{_{\mathbf{T}}}$  is then found to be

$$
\vec{v}_{T} = \vec{v}_{s} + \frac{1}{\Delta t} (\vec{R}_{2} - \vec{R}_{1}) . \qquad (6)
$$

**FIGURE 2.** Motion of Sensors  $s_1$  and  $s_2$  and of the Target T from Time  $t_1$  to Time  $t_2$ .

### 3. Lead Distance Geometry 3. Lead Distance Geometry

If, at some time  $t_{\ell}$  ( $t_{\ell}$  >  $t_2$ ), it is desired to lead the target on its track by a distance  $\ell$ , then the bearing  $\theta_{1\ell}$ and range  $R_{\ell}$  to this position from the primary sensor  $S_1$  is obtained by converting the vector  $[\psi_{T}, V_{T}(t_{\ell} - t_{2}) + \ell]$  to rectangular coordinates and adding it to the rectangular form of the position vector  $\vec{k}_2$  (see Figure 3). The resulting vector is then converted to polar coordinates to obtain the vector  $(0_{1\ell}, R_{\ell})$ . The predicted bearing and range  $\dot{r}_{\ell}$  of the target from the secondary sensor  $s<sub>2</sub>$  is computed from

$$
\vec{r}_2 = \vec{R}_2 - \vec{p} \quad . \tag{7}
$$
