HEWLETT-PACKARD

# HP-67 HP-97

### Users' Library Solutions Marketing/Sales

#### INTRODUCTION

In an effort to provide continued value to it's customers, Hewlett-Packard is introducing a unique service for the HP fully programmable calculator user. This service is designed to save you time and programming effort. As users are aware, Programmable Calculators are capable of delivering tremendous problem solving potential in terms of power and flexibility, but the real genie in the bottle is program solutions. HP's introduction of the first handheld programmable calculator in 1974 immediately led to a request for program solutions — hence the beginning of the HP-65 Users' Library. In order to save HP calculator customers time, users wrote their own programs and sent them to the Library for the benefit of other program users. In a short period of time over 5,000 programs were accepted and made available. This overwhelming response indicated the value of the program library and a Users' Library was then established for the HP-67/97 users.

To extend the value of the Users' Library, Hewlett-Packard is introducing a unique service—a service designed to save you time and money. The Users' Library has collected the best programs in the most popular categories from the HP-67/97 and HP-65 Libraries. These programs have been packaged into a series of low-cost books, resulting in substantial savings for our valued HP-67/97 users.

We feel this new software service will extend the capabilities of our programmable calculators and provide a great benefit to our HP-67/97 users.

#### A WORD ABOUT PROGRAM USAGE

Each program contained herein is reproduced on the standard forms used by the Users' Library. Magnetic cards are not included. The Program Description I page gives a basic description of the program. The Program Description II page provides a sample problem and the keystrokes used to solve it. The User Instructions page contains a description of the keystrokes used to solve problems in general and the options which are available to the user. The Program Listing I and Program Listing II pages list the program steps necessary to operate the calculator. The comments, listed next to the steps, describe the reason for a step or group of steps. Other pertinent information about data register contents, uses of labels and flags and the initial calculator status mode is also found on these pages. Following the directions in your HP-67 or HP-97 **Owners' Handbook and Program Listing I** and Program Listing I 19, HP-97), key in the program from the Program Listing I and Program Listing I 19, HP-97), key in the program from the Program Listing I and Program Listing I and Program Listing I indicates on which calculator the program was written (HP-67 or HP-97). If the calculator indicated differs from the calculator you will be using, consult Appendix E of your **Owner's Handbook** for the corresponding keycodes and keystrokes converting HP-67 to HP-97 keycodes and vice versa. No program conversion is necessary. The HP-67 and HP-97 are totally compatible, but some differences do occur in the keycodes used to represent some of the functions.

A program loaded into the HP-67 or HP-97 is not permanent—once the calculator is turned off, the program will not be retained. You can, however, permanently save any program by recording it on a blank magnetic card, several of which were provided in the Standard Pac that was shipped with your calculator. Consult your **Owner's Handbook** for full instructions. A few points to remember:

The Set Status section indicates the status of flags, angular mode, and display setting. After keying in your program, review the status section and set the conditions as indicated before using or permanently recording the program.

REMEMBER! To save the program permanently, **clip** the corners of the magnetic card once you have recorded the program. This simple step will protect the magnetic card and keep the program from being inadvertently erased.

As a part of HP's continuing effort to provide value to our customers, we hope you will enjoy our newest concept.

#### TABLE OF CONTENTS

FORECASTING USING EXPONENTIAL SMOOTHING	1
FINANCIAL TREND ANALYSIS. A set of the exponential function. Analyzes growth trends for a best fit exponential function. Includes several parameters of "goodness of fit".	11
SEASONAL VARIATION FACTORS (SEAVAR) Develops seasonal variation factors based on historical figures. The factors are useful for projecting seasonal sales. Can be used in conjunction with "Forecasting using Exponential Smoothing".	16
PRICE ELASTICITY OF DEMAND. Using historic (or estimated) prices and resulting unit sales, this program calculates the elasticity of demand.	20
EXPERIENCE (LEARNING) CURVE FOR MANUFACTURING COST Produces standard learning curve parameters useful in projecting production cost as a function of units produced.	24
BREAKEVEN ANALYSIS. Considers the operating leverage relation between fixed costs, variable cost, # of units, selling price and gross profit, and allows the user to dynamically evaluate the effect of various changes in any of the variables upon the other variables.	28
INCOME STATEMENT (P&L) ANALYSIS Allows the user to posit numerous alternatives in manufacturing cost, overhead, price etc, and see immediately the effect on the income statement.	32
INTERNAL RATE OF RETURN	40
SALES FORCE REQUIREMENTS Calculates the required number of salesmen when given average annual call frequency per salesman, number of customers forecasted and desired call frequency per customer.	47
COST & PRICE COMPUTATIONS Helps quickly and easily solve those problems of markup, margin and chain discounts.	51

r Program Ti	tle "Forecasting Using Expon	ential Smoothing"	
Contributor Address	's Name Robert Olsen, Profes Dept. of Marketing, LH-626,	ssor of Marketing California State University,	Fullerton
City	Fullerton	State California	Zip Code 92634

Program Description, Equations, Variables This is a singly-smoothed exponential forecasting routine which: (1) accommodates quarterly seasonal correction factors, (2) can handle some trend in the data, (3) produces smoothed estimates of current demand,  $D_t$ . (4) produces next-period smoothed demand estimates,  $D_{t+1}$ . (5) calculates a mean absolute deviation, MAD, and a tracking ratio, TR, (6) also provides a goodness-of-fit measure, V, which measures the variance between the next period's demand estimate to that period's actual demand, and (7) provides for convenient restarting when the user wants to update a data-series. While written for an HP-67, the program coding includes the option of printing all important results when an HP-97 is used.

Introductory Remarks. Exponential, is a special kind of moving average. It is often used for short-term sales and inventory forecasts. Typical forecast periods are a month or quarter of a year.

Unlike a moving average, exponential smoothing does not require a great deal of historical data. This program, for example, forecasts demand by using only a smoothing constant, an "old smoothed average," and a current-period usage statistic.

Normally, exponential smoothing uses data measured in physical quantities

Operating Limits and Warnings Should not be used with data which has more than a moderate amount of up or down trend. (Use double smoothing for data with a pronounced trend.) Program has no provision for error correction. Initializing resets the seasonal correction constants to 1.0.  $\hat{D}_{t+1}$  must be calculated for each time period if MAD. TR. or V are desired. At least two projections of  $\hat{D}_{t+1}$  must be done before MAD or TR can be calculated.

This program has been verified only with respect to the numerical example given in *Program Description II*. User accepts and uses this program material AT HIS OWN RISK, in reliance solely upon his own inspection of the program material and without reliance upon any representation or description concerning the program material.

NEITHER HP NOR THE CONTRIBUTOR MAKES ANY EXPRESS OR IMPLIED WARRANTY OF ANY KIND WITH REGARD TO THIS PROGRAM MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. NEITHER HP NOR THE CONTRIBUTOR SHALL BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH OR ARISING OUT OF THE FURNISHING, USE OR PERFORMANCE OF THIS PROGRAM MATERIAL.

(cases, tons, dozens, reams, etc.). It also can be used with dollar amounts but care must be taken to see that the amounts are stated in constant-dollar terms.

1. <u>Methodology</u>. This program is a versatile first-order smoothing routine for short-term forecasting with data having modest changes in its time-trend component. Such data will appear as a more-or-less horizontal line when plotted against time on a graph, with time being on the horizontal axis. If there is a trend in the plot this program will generate estimates which lag behind the trend line even though the formulas contain a trend correction factor. Double exponential smoothing should be used when the trend is pronounced.

Quarterly seasonal adjustments are available in this program but they are not required. This explanation begins without considering the deseasonalizing option. See Section 6 for the deseasonalizing option.

A trend-responsive first-order/from deseasonalized data is developed as follows.

a. Calculate a smoothed (weighted) average of: (1) actual demand/usage/ sales in the current time-period, and (2) the smoothed average of demand/usage/sales in prior time periods.

$$S_{+} = o(X_{+} + (1 - o)S_{+-1})$$

where

S = Current period's smoothed average Xt = Actual current period usage ∝ = 0 < ∝ < +1

b. Calculate the change,  $C_t$ , in the smoothed average  $S_t$  between this period (t) and the prior period (t-1).

$$C_t = S_t - S_{t-1}$$

c. Calculate the current smoothed rate-of-change (trend),  $T_t$ , in the smoothed average, S, between t-1 and t.

$$T_{+} = \alpha C_{+} + (1 - \alpha) T_{+-1}$$

d. Calculate the current period's expected usage, D<sub>t</sub>. This result is an exponentially smoothed projection of what usage is expected to be in the current time period, t. It is not a forecast for period t+1.

$$D_t = S_t + ((1 - \alpha) / \alpha) T_t$$

e. Forecast the next period's expected usage.

$$D_{t+1} = S_t + (1 / \ll) T_t$$

f. More generally, a forecast for n time periods in the future can be obtained from the formula

$$D_{t+n} = S_t + (1/\infty + n - 1)T_t$$

This formula is not included in the program but the necessary data can be gotten by inserting R/S instructions after Step 101 ( $S_t$ ) and Step 112 ( $T_t$ ). When Key B is pressed these values will appear after B, but before D,.

2. Choice of Smoothing Constant,  $\checkmark$ .  $\checkmark$  must be determined empirically. Low values of  $\checkmark$  make the trend line less responsive to new data. Responsiveness, however, means that the trend line will respond to spurious changes as well as real changes in trend. Brown and other authorities (see references below) recommend  $\checkmark$  values between 0.1 and 0.3. Trial-and-error experimentation usually is required to find a good  $\checkmark$  value for a time series. See Sections 4 and 5 for further comments.

3. <u>Starting Data</u>. The equations used for exponential smoothing constitute a system which has infinite regress. In theory one could go backwards in time forever because of the equation

 $S_{t} = A_{t} + (1 - A_{t})S_{t-1}$ 

Where should one stop (or begin)? Somehow, then, a starting value for S must be found. This program assumes a default option of S =  $X_{t-1}$  on the t-1 first iteration, following Buffa and Taubert. (This can be defeated. See Step 6 of the User Instructions.)

In addition, a starting value for T must be found. This program assumes a default option of T = 0. Again, this follows Buffa and Taubert. (This also can be defeated. See Step 5 of the User Instructions.)

These assumptions make it advisable not to forecast until at least four periods of current data have been entered (i.e., until Key B has been used at least four times).

4. <u>Tracking Signals</u>. Brown (p. 296) and Enrick (p. 17) describe the concept of a tracking signal, or tracking ratio. This measure is one way to evaluate goodness-of-fit. Conceptually, a tracking ratio is the cumulative sum of an equation's forecasting errors (either + or -) relative to the equation's cumulative mean absolute deviation.

A tracking ratio which is consistently close to 0.0 is good, while a tracking ratio which goes much above  $\pm 3$  is questionable. Exceeding 3 suggests that the process no longer is being controlled by the smoothing formula and that the researcher should develop a new formula to cope with changed conditions.

The formulas used here are from Enrick. They are simpler than Brown's and avoid several measurement problems which cannot be easily summarized in this write-up. The trade-offs are: (1) Enrick's tracking ratio is not as accurate for the first few iterations, and (2) Enrick's tracking ratio does not lend itself to statistical inference. (Brown's does.)

In this program all the calculations are done with deseasonalized data. Here are the formulas.

$$CFE = \left\{ \begin{array}{c} (x_t - \hat{D}_t) \\ CAD = \left\{ \begin{array}{c} \\ \\ \\ \end{array} \right\} \right\} \left[ (x_t - \hat{D}_t) \right] \\ MAD = CAD/B_{n-1} \\ TR = CFE/MAD \end{array}$$

CFE = Cumulative Forecast Error (can be + or -)
CAD = Cumulative Absolute Deviation
MAD = Mean Absolute Deviation
TR = Tracking Ratio
B<sub>n</sub> = Number of times a smoothed forecast D
thas been calculated (done by pressing
Key C after Key B after each entry of
data by Key B)

Notice the "hat" superscript over the D<sub>t</sub> values in the formulas. The hat emphasizes that the comparisons are being made between observed demand in period t and the forecasted demand projection made earlier in period t-1. Also notice that the formula for CFE is written so that an overforecast of demand results in a negative value for CFE. Conversely, an underforecast results in a positive value. This sign convention carries through to the tracking ratio results as well.

5. Variance Measure. This program also calculates a variance, V, as follows.

$$v = \frac{\xi e_i^2}{n} = \frac{\xi \begin{pmatrix} A_1 & - & X_t \end{pmatrix}}{B_n}$$

This variance is provided to give another measure of variability. It is useful for measuring variance as statisticians define it, but it is not a particularly good way to assess goodness-of-fit. Oftentimes the variance\*when  $\checkmark$  is set very high, such as in the range of 0.7 to 0.9. Such an  $\checkmark$  implies that the smoothing process is not working very well and that some other smoothing procedure should be tried. Restated, a high value of  $\checkmark$  implies that practically no smoothing is being done and that another approach should be tried. \*will be minimized

6. <u>Deseasonalization of Data</u>. The following examples show how seasonalized and deseasonalized data are distinguished in this write-up.

X<sub>t(S)</sub> = Actual usage, inclusive of a seasonal component X<sub>t(D)</sub> = Actual usage, deseasonalized D<sub>t(D)</sub> = Deseasonalized expected usage

Assuming that quarterly deseasonalizing constants,  $SV_i$  (i = 1, 2, 3, 4) are available, those constants can be entered into this program so that the deseasonalization will be done automatically. One program which will produce the correct seasonal constants is "Seasonal Variation Factors," in the Hewelett-Packard Marketing/ Sales Solutions Manual.

This program assumes that the seasonal factors will be used multiplicatively to eliminate seasonality. That is,

 $X_{t(S)} \cdot SV_{i} = X_{t(D)}$ 

A multiplicative constant of 0.909 (0.909 = 1.00/110%) thus would be used to deseasonalize an observation for a quarter which normally had a usage rate which was 10% greater than the annual average.

This process operates in the reverse when re-seasonalizing data. To obtain

where

 $\hat{D}_{t+1(S)}$ , for example, the following is done.  $\hat{D}_{t+1(D)}$ :  $SV_i = \hat{D}_{t+1(S)}$ 

7. <u>Counters for Time</u>. Two counters keep track of time.  $B_i$  records the number of times a smoothed demand estimate is calculated. It does that by counting the number of times Key B is pressed. Counter  $Q_i$  is used with the deseasonalizing adjustment option.  $Q_i$  keeps track of the fiscal quarter or calendar quarter associated with a given X. Since  $Q_i$  is entered by means of Key A for time period t-1,  $Q_i$  should always be for time period t-1.

Examples: (refer to the numbering convention in the next paragraph) -Suppose that  $X_{t-1}$  (Key A's input) is for the 4th calendar quarter of the preceding year. Then  $Q_i$  should be entered as 4. Now suppose that  $X_{t-1}$  is for the 2nd quarter of the current year. Then  $Q_i$  should be entered as 2.

Following is the numbering convention.

B,	=	1	lst	quarter	of	the	year
1		2	2nd	quarter	of	the	year
		3	3rd	quarter	of	the	year
		4	4th	quarter	of	the	year

Finally, Key f b assumes that the seasonal constants always will be entered in this order:  $SV_1$ ,  $SV_2$ ,  $SV_3$ , and  $SV_4$  (see the User Instructions). The order of entry via Key f b has <u>no</u> relationship to the Q<sub>1</sub> figure entered in the start-up process.

8. <u>Coding</u>. The basic coding is relatively straightforward. The one thing to remember is that all values are time-dated. The coding in f LBL 0 may there-fore seem confusing, for it uses  $D_{t+1}$  values calculated in prior time periods as the basis for its calculations. Just keep in mind that those values were calculated one iteration earlier.

Some users are likely to want to modify the instructions used here for the program stops (h PAUSE, f -x-, R/S) to better fit their needs. That can be done, but be sure not to alter any h RTN instructions without carefully considering the consequences. Changes in some of them could cause the program to "run through" a label and desynchronize the time-counters  $B_i$  and  $Q_i$ . Also, 97 users may want to add print-outs of the input data: only results are printed in this program.

9. <u>Limitations</u>. The chief limitation of this program is the limitation of the methodology itself. First-order exponential smoothing is not appropriate for data with a pronounced upward or downward trend. A lesser shortcoming is the need to let the start-up assumptions work themselves out of the equation system.

References. Robert Goodell Brown, <u>Smoothing</u>, Forecasting, and Prediction of <u>Discrete Time Series</u> (Englewood Cliffs, N.J.: Prentice-Hall, 1963). An excellent general introduction to the subject.

Elwood S. Buffa and William H. Taubert, <u>Production-Inventory Systems: Planning</u> and Control, Rev. ed. (Homewood, Illinois: Richard D. Irwin, 1972), pp. 44-45. Has the formulas used for Keys B and C.

Norbert Lloyd Enrick, <u>Market and Sales Forecasting</u> (San Francisco, Calif.: Chandler Publishing Co., 1969), p. 17. Has the formulas for Key D.

Program Title	SEASONAL VARIATION	FACTORS		
Contributor's Name Address	Hewlett Packard 1000 N.E. Circle	Boulevard		
City	Corvallis	State Oregon	Zip Code	97330

Program Description, Equations, Variables, etc.

This program utilizes the four quarter moving average, two item averaging technique to develop seasonal variation factors. The technique should be applied whenever the historical data appears to have a short term cycle, i.e. less than a year. If forecasting with exponential smoothing is to be done on a basis other than quarterly it is suggested that the historical data may be grouped into quarterly figures, the quarterly seasonal variations developed, and graphed over time. The quarterly seasonal variation figures should be plotted in the center of the quarter. Seasonal variation factors for other time periods, i.e. monthly, semi-annually, etc., may then be extrapolated from the plotted graph. These extrapolations should be determined at the center of the time period involved. When graphing, the user is reminded that seasonal variation at December 31 must equal seasonal variation at January 1.

#### **Operating Limits and Warnings**

1) D has not been used as a subroutine. Depression of this key will cause indeterminant errors. Program should be restarted.

- E is a subroutine used in data manipulation and should not be depressed. Depression of this key will cause erroneous results. Program should be restarted.
- 3) A minimum of two years data is required.

This program has been verified only with respect to the numerical example given in *Program Description II*. User accepts and uses this program material AT HIS OWN RISK, in reliance solely upon his own inspection of the program material and without reliance upon any representation or description concerning the program material.

Program Title PRIC	E ELASTICITY OF DEM	IAND	
Contributor's Name	Hewlett Packard		
Address	1000 N.E. Circle E	Boulevard	
City	Corvallis	State Oregon	<b>Zip Code</b> 97330

Program Description, Equations, Variables Mathematical model: Ed = $\left[\frac{\Delta Q}{Q_{i} + Q} / \frac{\Delta P}{P_{i} + P_{i+1/2}}\right]$
Where:
Ed = Demand elasticity
(That is elasticity of quantity sold with respect to
a change in price.)
$Q_{i+1} = Quantity$ sold after price change
Q <sub>i</sub> = Quantity sold before price change
P = New price
P <sub>i</sub> = Old price
[for i= 1,2,3, n]
$\Delta Q = [Q_{i+1} - Q_i]$
$\Delta P = [P_{i+1} - P_i]$
Operating Limits and Warnings

Program Title Expe	erience	(Learning)	Curve	for	Manufacturing	Cost	
Contributor's Name	Hewlet	t Packard					
Address	1000 M	N.E. Circle	Boule	vard			
City	Corval	llis		State	Oregon	Zip Code	97330

Program Description, Equations, Variables Many production process costs vary with
output in close relation to the learning curve:
$Cn = C_{1}n \qquad \log r/\log 2$
where C <sub>1</sub> is the cost of the first unit produced C <sub>n</sub> is the cost of the n <sup>th</sup> unit produced n is the number of units produced r is a special constant arrived by through empirical
analysis
This program solves for any of the above variables and also
solves for average cost over a range from i to j using the formula:
$\overline{C}_{n} = \frac{C}{\frac{1}{j-1}} \frac{j}{\frac{j}{j-1}}$ where B = log r/log 2
Operating Limits and Warnings The theory applies to a single product, or closely
related series of similar products.
The average cost is only approximate since the function is
continuous although the data is discrete the greater n, the less
the error.

This program has been verified only with respect to the numerical example given in *Program Description II*. Program Title	ogram Title INCOME STATEMENT (P & L) ANALYSIS												
Contributor's Name	Hewlett Packard												
Address	1000 N.E. Circle H	Boulevard											
City	Corvallis	State	Oregon	<b>Zip Code</b> 97330									

Program Description, Equations, Variables Using the standard product income formula
Net Income = (l-Tax) (Net sale price - Mfg Op Ex)
Although freely capable of calculating in dollars or percents,
the dynamic simulator operates only with net income return (%) and
percent operating expense. Both percentage figures are based on
<u>net</u> sales price.
net sale = list (l-discount (%)*)
operating expense (%) = operating expense ÷ net sale price
The program can also be used to simulate a company wide income
statement by replacing list with gross sales, and manufacturing
cost with cost of goods sold.
<b>Operating Limits and Warnings</b> * discount is a percentage of <u>list</u>
The program assumes a tax rate of 48%. Since the rate varies from
company to company, the .52. (148) in the program must be replaced
by one minus your applicable tax rate (steps: 44-5, 64-5, 112-3,
190-1)

This program has been verified only with respect to the numerical example given in *Program Description II*. User accepts and uses this program material AT HIS OWN RISK, in reliance solely upon his own inspection of the program material and without reliance upon any representation or description concerning the program material.

- b) if manufacturing is increased to \$3.25, what is the effect of the return.
  - c) what is the total net dollar cash flow if 10,000 units are sold. (assuming the 3.25 manufacturing cost)
  - d) how high could the overhead (operating expense) go before the product begins to lose money.
- e) how sensitive is the profit to the selling price (for each dollar below \$12.00)
  - f) print out an income statement for the final selling price of 10.49, 35% discount, \$3.00 manufacturing cost and 32% operating expense.

Program Title	NTERNAL RATE OF RETURN		
Contributor's Name	HEWLETT-PACKARD COMPANY Corvallis Division		
City	1000 N.E. Circle Boulevard Corvallis, OR 97330	State	Zip Code

Program Descript	$\begin{array}{c} CF \\ \hline \\ $
	Note:
·	The above diagram is representative of diagrams which will be used in this pac. The horizontal line represents the time period(s) involved, while the arrows represent the cash flows.
	The interest rate that equates the present value of all future cash flows with the original investment is known as the internal rate of return (IRR, also called discounted rate of return or yield). Given a non-zero initial investment and up to 44 <b>positive</b> cash flows, this program calculates the periodic IRR. If there are negative as well as positive cash flows, the program accepts up to 22 cash flows.
·	If more than 44 positive cash flows are entered, all cash flows over 44 will be ignored. There will be no indication, however, that more than 44 cash flows have been entered. Likewise, if more than 22 positive and negative cash flows are entered, erroneous results will occur.
	Zero should be entered for periods with no cash flow.
Operating Limits a	When more than 22 cash flows are involved (all of which must be positive), the user is asked to enter the largest cash flow in step 3 because of the storage techniques being used. This value is then used to scale all other cash flows, and depending on these values, accuracy may be reduced. Consequently, the resulting periodic rate of return should be considered accurate to within $\pm .01\%$ (.0001 decimal). This largest cash flow must be entered again in sequence in step 4. If a cash flow larger than the value entered for CF MAX is keyed in at step 4, erroneous results may occur.
	The answer produced is the <i>periodic rate of return</i> . If the cash flow periods are

Program Descri	ption, Equations, Variables	
	other than annual (monthly, quarterly) the answer should be number of periods per year to determine the annual intern	e multiplied by the al rate of return.
	In many instances another program may be more suitable for all cash flows are equal and equally spaced, or if all cash flows are equal and equally spaced. DIRECT REDUCTION IO	calculating IRR. If ows except the last

better choice. If the cash flows occur in groups of uneven amounts, IRR-

This program was designed for optimum operation when the interest rate being solved for is between 0 and 100%. The program will often solve for interest rates outside this range, but occasionally may halt prematurely with ERROR in the display. This is an error condition generated by an intermediate calculation,

The calculated answer may be verified by using DISCOUNTED CASH FLOW ANALYSIS—NET PRESENT VALUE (BD-03), to calculate the net present

When the sign of the cash flows is reversed more than once, more than one interest rate is considered correct in the mathematical sense. While this program may find one of the answers, it has no way of finding or indicating

and indicates that the program cannot solve that particular problem.

GROUPS (BD-02) may be more suitable.

value. The NPV should be close to 0.

Program Description, Equations, Variables The calculation of required salesman to cover n territories utilizes the model: 1.  $\sum_{N=\frac{i=1}{P}}^{n} C_{i} F_{i}$ Where: 2. n = Desirable number of salesmen C<sub>i</sub>= Number of customers in class size i  $F_{i}$  = The desirable number of annual calls to make to customers in size class i. P = The annual average numbers of calls to be made by a salesman.  $\eta$  = The number of customer size classes **Operating Limits and Warnings** The optimality of the overall solution depends upon managements accuracy in estimating call frequencies for different size accounts.

This program has been verified only with respect to the numerical example given in *Program Description II*. Program Title COST AND PRICE COMPUTATIONS											
Contributor's Name Address	Hewlett Packard 1000 N.E. Circle Boulevard										
City	Corvallis	State	Oregon	Zip Code	97330						

Program Description, Equations, Variables Sales work often involves calculating the unknown
amongst the interrelated terms margin, markup, selling price, and cost. Margin is
defined as 100 x (selling price-cost)/ selling price. Markup is 100 x (selling
price - cost)/cost.
There are numerous equations which evolve from the interrelation of these terms.
This program solves for any of the four variables when two of the other variables

are known. In addition, with discount synonymous with margin, list with selling price and

net with cost, this program calculates any unknown among list, net and up to three consecutive discounts rates.

**Operating Limits and Warnings** 

This program has been verified only with respect to the numerical example given in *Program Description II*. User accepts and uses this program material AT HIS OWN RISK, in reliance solely upon his own inspection of the program material and without reliance upon any representation or description concerning the program material.

NEITHER HP NOR THE CONTRIBUTOR MAKES ANY EXPRESS OR IMPLIED WARRANTY OF ANY KIND WITH REGARD TO THIS PROGRAM MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. NEITHER HP NOR THE CONTRIBUTOR SHALL BE LIABLE FOR INCIDENTAL OR CONSEQUEN-TIAL DAMAGES IN CONNECTION WITH OR ARISING OUT OF THE FURNISHING, USE OR PERFORMANCE OF THIS PROGRAM MATERIAL.

Sketch(es)
Sample Problem(s)
a) If the margin is 20% and cost is \$160, what is the selling price?
b) If the margin is 30% what markup would this be?
c) If list price is \$3.28, net is \$1.45 and two of the discounts are 48% and
5%, what is the third discount rate?
d) If list price is 6.20 and there are two discount rates, 50% and 2% what is the
net?
e) The discounts 20%, 5%, and .5% are equivelant to what single discount rate.
a) 20 [C], 160 [B] [A] 200
$D)  30  [C]  [D]  \dots  42.80\%$
$\begin{array}{cccccccccccccccccccccccccccccccccccc$
a) $6.20$ [I] [A] $50$ [I] [C] 2 [I] [D] 0 [I] [E] [I] [B] $\dots 3.04\%$
e) 1 [I] [A] 20 [I] [C] 5 [I] [D] .5 [I] [E] [I] [B] 1 $[X < Y$ ] [-]24 or 24

NOTES

#### NOTES

#### **Hewlett-Packard Software**

In terms of power and flexibility, the problem-solving potential of the Hewlett-Packard line of fully programmable calculators is nearly limitless. And in order to see the practical side of this potential, we have several different types of software to help save you time and programming effort. Every one of our software solutions has been carefully selected to effectively increase your problem-solving potential. Chances are, we already have the solutions you're looking for.

#### **Application Pacs**

To increase the versatility of your fully programmable Hewlett-Packard calculator, HP has an extensive library of "Application Pacs". These programs transform your HP-67 and HP-97 into specialized calculators in seconds. Each program in a pac is fully documented with commented program listing, allowing the adoption of programming techniques useful to each application area. The pacs contain 20 or more programs in the form of prerecorded cards, a detailed manual, and a program card holder. Every Application Pac has been designed to extend the capabilities of our fully programmable models to increase your problem-solving potential.

You can choose from:

#### Statistics Mathematics Electrical Engineering Business Decisions Clinical Lab and Nuclear Medicine

Mechanical Engineering Surveying Civil Engineering Navigation Games

#### **Users' Library**

The main objective of our Users' Library is dedicated to making selected program solutions contributed by our HP-67 and HP-97 users available to you. By subscribing to our Users' Library, you'll have at your fingertips, literally hundreds of different programs. No longer will you have to: research the application; program the solution; debug the program; or complete the documentation. Simply key your program to obtain your solution. In addition, programs from the library may be used as a source of programming techniques in your application area.

A one-year subscription to the Library costs \$9.00. You receive: a catalog of contributed programs; catalog updates; and coupons for three programs of your choice (a \$9.00 value).

#### **Users' Library Solutions Books**

Hewlett-Packard recently added a unique problem-solving contribution to its existing software line. The new series of software solutions are a collection of programs provided by our programmable calculator users. Hewlett-Packard has currently accepted over 6,000 programs for our Users' Libraries. The best of these programs have been compiled into 40 Library Solutions Books covering 39 application areas (including two game books).

Each of the Books, containing up to 15 programs without cards, is priced at \$10.00, a savings of up to \$35.00 over single copy cost.

The Users' Library Solutions Books will compliment our other applications of software and provide you with a valuable new tool for program solutions.

#### **MARKETING/SALES**

Anyone in sales or marketing, whether a small businessman or a large corporate manager, should find these programs covering sales forecasting, price and profitability analysis useful and time saving.
