## HIP(OTHPOT <br> Users' Library Solutions <br> Reliability/QA

## INTRODUCTION

In an effort to provide continued value to it's customers, Hewlett-Packard is introducing a unique service for the HP fully programmable calculator user. This service is designed to save you time and programming effort. As users are aware, Programmable Calculators are capable of delivering tremendous problem solving potential in terms of power and flexibility, but the real genie in the bottle is program solutions. HP's introduction of the first handheld programmable calculator in 1974 immediately led to a request for program solutions - hence the beginning of the HP-65 Users' Library. In order to save HP calculator customers time, users wrote their own programs and sent them to the Library for the benefit of other program users. In a short period of time over 5,000 programs were accepted and made available. This overwhelming response indicated the value of the program library and a Users' Library was then established for the HP-67/97 users.

To extend the value of the Users' Library, Hewlett-Packard is introducing a unique service-a service designed to save you time and money. The Users' Library has collected the best programs in the most popular categories from the HP-67/97 and HP-65 Libraries. These programs have been packaged into a series of low-cost books, resulting in substantiai savings for our valued HP-67/97 users.

We feel this new software service will extend the capabilities of our programmable calculators and provide a great benefit to our HP-67/97 users.

## A WORD ABOUT PROGRAM USAGE

Each program contained herein is reproduced on the standard forms used by the Users' Library. Magnetic cards are not included. The Program Description I page gives a basic description of the program. The Program Description II page provides a sample problem and the keystrokes used to solve it. The User Instructions page contains a description of the keystrokes used to solve problems in general and the options which are available to the user. The Program Listing I and Program Listing II pages list the program steps necessary to operate the calculator. The comments, listed next to the steps, describe the reason for a step or group of steps. Other pertinent information about data register contents, uses of labels and flags and the initial calculator status mode is also found on these pages. Following the directions in your HP-67 or HP-97 Owners' Handbook and Programming Guide, "Loading a Program" (page 134, HP-67; page 119, HP-97), key in the program from the Program Listing I and Program Listing II pages. A number at the top of the Program Listing indicates on which calculator the program was written (HP-67 or HP-97). If the calculator indicated differs from the calculator you will be using, consult Appendix E of your Owner's Handbook for the corresponding keycodes and keystrokes converting HP-67 to HP-97 keycodes and vice versa. No program conversion is necessary. The HP-67 and HP-97 are totally compatible, but some differences do occur in the keycodes used to represent some of the functions.

A program loaded into the HP-67 or HP-97 is not permanent-once the calculator is turned off, the program will not be retained. You can, however, permanently save any program by recording it on a blank magnetic card, several of which were provided in the Standard Pac that was shipped with your calculator. Consult your Owner's Handbook for full instructions. A few points to remember:

The Set Status section indicates the status of flags, angular mode, and display setting. After keying in your program, review the status section and set the conditions as indicated before using or permanently recording the program.

REMEMBER! To save the program permanently, clip the corners of the magnetic card once you have recorded the program. This simple step will protect the magnetic card and keep the program from being inadvertently erased.

As a part of HP's continuing effort to provide value to our customers, we hope you will enjoy our newest concept.

## TABLE OF CONTENTS

RELIABILITY: INTRA-CLASS CORRELATION ..... 1Using a one-way ANOVA layout, this program estimates the ratio of variancedue to treatment (CF. true scores) to total or "Observed" variance. Thisis interpreted as a measure of the extent to which group membership isrelated to the magnitude of the observed score. In turn, this can be usedto estimate the reliability of a measurement with the treatment levelsbeing subjects.
SPECIFICATION COMPLIANCE FROM LIMITS AND REGRESSION ANALYSIS ..... 5
Calculates predicted value from regression analysis constants, and standar'd normal deviate from standard deviation and specification limits. Also calculates $x$ or $y$ value at $90 \%$, $95 \%$ or $99 \%$ limits about the regression line. Very useful for calculating a table of values from regression constants for determining probability of specification compliance in process control or EVOP applications.
PARAMETER ESTIMATION (EXPONENTIAL DISTRIBUTION) ..... 9
Computes (1) the maximum likelihood estimate for the scale parameter' of an exponential distribution which is singly truncated on the right, and (2) the minimum variance unbiased estimate for the parameters of a two-parameter exponential distribution which is singly censored on the right.
LOWER LIMIT OF RELIABILITY - BINOMIAL DISTRIBUTION ..... 13
This program calculates the lower limit of reliability at a s'pecified confidence level using the binomial distribution.
RELIABILITY AND PROBABILITY OF FAILURE OF SERIES AND PARALLEL SYSTEMS ..... 17
Computes the reliability and failure probability of a parallel system, series
system or combination parallel/series system given mission time, number of
components and component failure rates.
MIL - STD - 883 CALCULATED LEAK RATE ..... 21
Gives the calculated leak from the measured leak rate using the equation given the MIL-STD-883, Method 1014, Condition A.
MLE: $\hat{\theta}$ FROM HAZARD RATE ..... 25
Given failure numbers and operating time for' a sámple 'te'st' da'ta', pro'grám computes differential operating times, maximum likelyhood estimator ( $\hat{\theta}$ ) from operating times; failure dates $\left[Z\left(t_{j}\right)\right]$; parameter $\lambda$ and finally MLE; $\hat{\theta}$ from hazard rate (i.e. $\lambda$ ).
MLE: $\hat{\theta}$ BY LEAST SQUARE METHOD ..... 30
Given the test failure data; program 'compute's maximum'likeiyhood ést'imátór using' least square technique. It also computes the probability of survival which helps compute the reliability of any given subject.
SYSTEMS RELIABILITY-SERIES AND PARALLEL WITH SAME FAILURE RATE $\lambda$38Given different number of components and the corresponding failure rates $\lambda$ of asystem, program calulates reliability (probability of survival); unreliability;total systems reliability when put in series and total systems reliability whenput in parallel by using unreliability concept. NOTE: All such units inseries or parallels must have same $\lambda$.
SYSTEMS RELIABILITY-SERIES AND PARALLEL WITH DIFFERENT FAILURE RATE $\lambda$, This program calculates the reliability of the system when components or units of different failure rate $\lambda$ are placed in series or parallel by using concept of unreliability to avoid tedious and lengthy calculations specially when system is in parallel.
City Corvallis State Oregon Zip Code 97330

Program Description, Equations, Variables, etc. Let the scores (measures) $X_{i j}$ represent the j-th subject's score on the i-th teat (measurement). In the ANOVA model $X_{i j}=\mu+a_{j}+e_{i j}, \mu$ the mean "true" measure over all subjects, $a_{j}$ the deviation of the $j$-th subject from that mean, and $e_{i j}$ the error in test $i$ on the $j$-th subject, the reliability of the set of tests is the ratio $\rho_{I}=\sigma_{A}^{2} / \sigma_{X}^{2}$, of true-difference variance to observed-score variance. Ihis ratio is estimated by the formula

$$
r_{I}=\frac{M S_{B e t}-M S_{W i t h}}{M S_{B e t}+(c-I) M S_{W i t h}}
$$

where $M S_{B e t}$ is the between mean squares, $M S_{W i t h}$ the within mean squares, and $c$ is a factor dependent on sample size given by

$$
c=\frac{1}{J-1}\left[\sum n_{j}-\frac{\sum n_{j}^{2}}{\sum n_{j}}\right]
$$

where $J$ is the number of subjects, $n_{j}$ the number of test scores for subject $j$. Standard formulas are used for the mean squares, and the ANOVA F-ratio is computed as a by-product of the main program.

Operating Limits and Warnings
This estimate is based on the ANOVA randomeffects model, and violations of its assumptions (e.g., normal distribution of the $a_{j}$, homogeneity of variances) should be held to a minimum for an accurate estimate. Winer (op. cit.) and other texts fully explain these assumptions and possible effects of departures. Most ill effects are minimized by use of equal $n_{j}^{\prime}$ 's, for all $j=1,2, \ldots, J$.

[^0]
## Program Description II

## Sketch(es)

Sample Problem(s) The following data represent the scores of three subjects on repeated measurements of the same attribute. Compute the intra-class correlation (reliability) estimate and the ANOVA F.

| j | 1 | 2 | 3 | 4 | 5 | 6 |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 1 | 10 | 8 | 5 | 12 | 14 | 11 |

## Program Description

Program Title SPECIFICATION COMPLIANCE from LIMITS and REGRESSION ANALYSIS

Contributor's Name Hewlett-Packard Company
Address 1000 N.E. Circle Boulevard
City Corvallis
State Oregon
Zip Code 97330

Program Description, Equations, Variables

$$
\begin{aligned}
& X_{i}=X_{0}+\Delta x \\
& X_{i+1}=X_{i}+\Delta x \\
& Y_{i}=A+B X i \\
& Z_{L}=\frac{Y_{i}-L}{S} ; P_{L}=f\left(Z_{L}\right) \text { Note } 1 \\
& Z_{u}=\frac{U-Y_{i}}{S} ; P_{u}=f\left(Z_{u}\right) \text { Note } 1 \\
& Y_{u}=U-Z S \quad ; X_{u}=\frac{Y_{u}-A}{B} \\
& Y_{L}=L+Z S \quad ; \quad X_{L}=\frac{Y_{L}-A}{B}
\end{aligned}
$$

NOTE $1: P_{L}$ and $P_{u}$ are the probability of meeting the lower or upper specification limits respectively. They are found from a table of the normal probability distribution at the value of $\mathrm{Z}_{\mathrm{L}}$ or $\mathrm{Z}_{\mathrm{u}}$ in question.

## Operating Limits and Warnings

|  |  |  |  |  |  |  |  |  |

Sample Problem(s)
The following information is obtained from a regression analysis for a linear equation: $A=20 ; B=1.5 ; S=4.0$. What are the probabilities of meeting specification limits of $L=50$ and $U=80$ as $X$ varies from 15.0 to 45.0 in steps of 5.0 ? What are the $X$ values at the specification limits and the $x$ and $y$ values at the lower and upper $90 \%$ confidence limits?

Solution(s) Insert program: $20 \uparrow, 1.5 \uparrow, 4.0 \uparrow, 15.0$, [f] [A] $50 \uparrow, 80 \uparrow, 5.0$ [R/S]
[A] $y_{0}=42.50 ;[B] Z_{L}=-1.88 ;[C] Z_{u}=9.38 ;[D] X_{1}=20.00 ;[A] y_{1}=50.00$
[B] $Z_{L}=0.00 ;[C] Z_{u}=7.50 ;[D] X_{L}=25.00$. . . etc. to complete the table shown under sketches.

For the x values at the specification limits [CLX] [E] $\mathrm{Y}_{\mathrm{L}}=50.00$;
$[\mathrm{R} / \mathrm{S}] \mathrm{X}_{\mathrm{L}}=20.00$; [f] [STF] [1] [CLX] [E] $\mathrm{Y}_{\mathrm{u}}=80.00 ;[\mathrm{R} / \mathrm{S}] \mathrm{X}_{\mathrm{u}}=40.00$
For 90\% limits [f][CLF][1]
[GTO][1][R/S][E] $\mathrm{Y}_{\mathrm{L} 90}=55.13$; [R/S] $\mathrm{X}_{\mathrm{L} 90}=23.42 ;[\mathrm{f}][\mathrm{STF}][1][\mathrm{GTO}][1][\mathrm{R} / \mathrm{S}][\mathrm{E}]$
$Y_{u 90}=74.87 ;[R / S] X_{u 90}=36.58$

Program Title PARAMETER ESTIMATION (EXPONENTIAL DISTRIBUTION)

Contributor's Name Hewlett - Packard Company
Address 1000 N.E. Circle Boulevard
City Corvallis
State Oregon
Zip Code 97330

## Program Description, Equations, Variables

## Case 1

Let $X$ be the sample mean of a random sample of size $n$ from a truncated exponential distribution with pdf.

$$
f(x)=\sigma^{-1} e^{-x / \sigma}\left(1-e^{-x o / \sigma)} \quad 0 \leqslant x \leqslant X_{0}\right.
$$

The maximum likelihood estimator $\hat{\sigma}$ for $\sigma$ is the solution of

$$
\bar{x}-\hat{\sigma}+x_{0}\left(e^{x^{\circ} / \hat{\sigma}}-1\right)^{-1}=0
$$

## Case 2

Let $X_{(1)}<X_{(2)} \cdot \cdots<X_{(r)}$ denote the first $r$ order statistics from a random sample of size $n$ from a distribution with pdf.

$$
f(x)=\sigma^{-1} \operatorname{EXP}(-(x-\theta) / \sigma) \quad \theta \leqslant x \leqslant \infty
$$

The minimum variance unbiased estimators for $\sigma$ and $\theta$ are

$$
\begin{aligned}
& \sigma^{*}=(r-1)^{-1} \sum_{j=2}^{r}(n-j)\left(X_{(j+1)}-X_{(j)}\right) \\
& \theta^{*}=X_{(1)}-\sigma^{* / n}
\end{aligned}
$$

Operating Limits and Warnings In case $1, \sigma$ is finite only if $X<X_{0} ; 2$. If $X>X_{0} / 2$, then $\hat{\sigma}$ is infinite - this means that the truncated exponential distribution is not a good model for the observations. Program may not work when $\overline{\mathrm{X}}$ is very close to $\mathrm{X} \circ / 2$.

This program has been verified only with respect to the numerical example given in Program Description II. Program Description, Equations, Variables

$$
(1-\gamma)=\sum_{j=0}^{x}\left[\frac{N!}{j!(N-j)!}\right] P^{j}(1-P)^{N-j}
$$

where $N=$ total number of items tested
$\mathbf{j}=$ number of items failed
$\gamma=$ confidence level (in decimal form . XX )
P = probability of failure
$(1-P)=$ reliability $=R_{L . X}$
$\alpha=\frac{(1-\gamma)-(1-\gamma) \text { calculated }}{(1-\gamma)} \quad$ allowable error

Operating Limits and Warnings $\quad \mathrm{N} \leqslant 69$
$.50<\gamma<.99$ for most cases $\gamma$ will not work if outside this range.

## Program Description II

Sample Problem(s) A) Twenty rocket motors are fired with one failure; what is the demonstrated reliability at the lower $90 \%$ confidence level?
B) Fifty components are tested at $1 / 2$ times their normal rated loading; what is the maximum number of failures that can be obtained and still demonstrate a . 87 reliability at a $95 \%$ confidence level?
C) What is the reliability of 1 failure out of 15 tests of the $90 \%$ confidence level calculated to four decimal places ( $\alpha \leq .001$ ).

Solution(s) A) 20 [ $\uparrow$ ], 1 [A] [B]
$\rightarrow 0.82$
B) 50 [ $\uparrow$ ], 1 [A], . 95 [C]
0.91

50 [t], 2 [A], . 95 [C]
0.88
$50[\uparrow], 3[A], .95$ [C]
0.85
only 2 failures can be obtained
C) $15[\uparrow], 1$ [A], $.001[S T O][7][B] \rightarrow 0.7645$

$16$

Program Description, Equations, Variables Given the mission time $t$, number of parallel components $n_{i}$, failure rates $\lambda_{i j}$ and reliability block diagram of a parallel, series or combination parallel/series system, the program calculates the following values:

$$
\text { Probability of Failure } Q_{s}(t)=1-R_{s}(t)
$$

$$
\text { Reliability } R_{s}(t)=\prod_{i=1}^{k} R_{i}(t)
$$

$$
\text { where } k=\text { number of parallel groupings in series }
$$

$$
\begin{aligned}
R_{i} & =R_{i(j-1)}+\left(1-R_{i(j-1)}\right) R_{i j} \quad 1 \geqslant j \geqslant n_{i} \\
R_{i j} & =\exp \left(-\lambda_{i j} t\right)
\end{aligned}
$$

Operating Limits and Warnings $n$ is a positive integer and $\lambda \geqslant 0$.

This program has been verified only with respect to the numerical example given in Program Description II. 97 Program Listing I

# Program Description I 

Program Title MIL-STD-883 CALCULATED LEAK RATE

Contributor's Name
Hewlett-Packard
Address
1000 N.E. Circle Blvd.
City Corvallis
State Oregon
Zip Code 97330

## Program Description, Equations, Variables

MIL-STD-883A Method 1014.1 Condition $A_{2}$ requires a calculated leak rate using the equation

$$
R=L \frac{P_{E}}{P_{0}} \sqrt{\frac{M_{a}}{M}}\left\{1-\exp \left[-L \frac{t_{1}}{V P_{0}} \sqrt{\frac{M_{a}}{M}}\right]\right\} \exp \left[-L \frac{t_{2}}{V P_{0}} \sqrt{\frac{M_{a}}{M}}\right]
$$

To calculate $L$ given the value for $R$. This equation must be solved iteratively for $L$. Solution is done using the Newton procedure for refining the trial values for $L$.

The user is referred to MIL-STD-883 for the meaning and complete description of variables and test techniques.

```
\(\mathrm{R}=\) Measured leak rate
\(\mathrm{L}=\) Calculated leak rate cc/sec
\(P_{E}=\) Bomb pressure (usually 5 atm)
\(t_{1}=\) Pressurization time sec.
\(P_{0}=\) Atmospheric pressure (1 atm)
\(t_{2}=\) Time from end of pressure to measurement sec.
\(\frac{M_{a}}{M}=\) Ratio of molecular wts of air to tracer gas (assumed He)
```

## Operating Limits and Warnings

Mathematically there is no limit, but calculation time is less for $1 \%$ than for . $01 \%$. $1 \%$ is adequate for most experimental setups.

This program has been verified only with respect to the numerical example given in Program Description II. User accepts and uses this program material AT HIS OWN RISK, in reliance solely upon his own inspection of the program material and without reliance upon any representation or description concerning the program material.

NEITHER HP NOR THE CONTRIBUTOR MAKES ANY EXPRESS OR IMPLIED WARRANTY OF ANY KIND WITH REGARD TO THIS PROGRAM MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. NEITHER HP NOR THE CONTRIBUTOR SHALL BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH OR ARISING OUT OF THE FURNISHING, USE OR PERFORMANCE OF THIS PROGRAM MATERIAL.

## Sketch(es)

## Sample Problem(s)

For the inputs
$R=7.2 \times 10^{-8}$
$t_{1}=3600 \mathrm{sec}$
$t_{2}=300 \mathrm{sec}$
$v=1.1684 \mathrm{cc}$
ERROR = . 01
The program should return the value $8.058-07$. Keying RCL 3 will tell you that it took 6 iterations to obtain the answer.

Solution(s) Keystrokes:
Outputs:

```
7.2 [EEX][CHS][8][STO][8], 3600 [STO][1], 300 [STO][2],
1.1684 [STO][3], 2.678 [STO][4], .01 [STO][5]
[SCI][DSP][3][A] }\quad->8.058 -07
[RCL][3] }->6.000 0
```

# Program Description I 

| Program Title MLE: $\hat{\theta}$ FROM HAZARD RATE |  |  |
| :---: | :---: | :---: |
| Contributor's Name Hewlett-Packard Company |  |  |
| Address 1000 N.E. Circle Boulevard |  |  |
| City Corvallis | State Oregon | Zip Code 97330 |

Program Description, Equations, Variables Given the test failure data of the sample, the program computes differential failure times ( $\Delta \mathrm{t}_{\mathbf{i}}$ ); mean time to failure (MTTF); failure rate $Z\left(t_{i}\right)$; parameter $\lambda$ (constant hazard rate) and $\hat{\theta}$ from this hazard rate.

Following formulas and variables are used:

1) $\Delta t_{i}=t_{i}-t_{i-1}$;
where $i=0,1,2,3, \ldots n$ failures

$$
\begin{aligned}
& \mathrm{t}_{\mathbf{i}}=\text { time to failures } \\
& \mathrm{N}_{\mathbf{O}}=\text { total } \# \text { of fallures }
\end{aligned}
$$

$$
\text { 3) } Z\left(t_{i}\right)=\frac{n\left(t_{i}\right)-n\left(t_{i}+\Delta t_{i}\right)}{\Delta t_{i}} \cdot \frac{1}{N_{s}\left(t_{i}\right)} \text {; }
$$

3) $Z\left(t_{i}\right)=\frac{n\left(t_{i}\right)-n\left(t_{i}+\Delta t_{i}\right)}{\Delta t_{i}} \cdot \frac{1}{N_{S}\left(t_{i}\right)}$; where $\left[n\left(t_{i}\right)-n\left(t_{i}+\Delta t_{i}\right)\right]$
is \# of failures in that
time difference.
$N_{S}\left(t_{i}\right)=\#$ survived at $t_{i}$.
4) $\lambda=\frac{\Sigma Z\left(t_{i}\right)}{N_{0}}=\bar{Z}\left(t_{i}\right) \quad ; \quad \lambda=$ parameter (hazard rate) i.e. mean of total $Z\left(t_{i}\right)^{\prime} s$.

$$
\text { 5) } \underset{\underset{\underset{\sim}{\text { hazard }}}{\text { rate }}}{\hat{\theta}_{\mathrm{Z}}(t)}=\frac{1}{\lambda} \text {; }
$$

[MLE from hazard rate]

| Program Title MLE: $\hat{\theta}$ BY LEAST SQUARE METHOD |  |  |
| :--- | :--- | :--- |
| Contributor's Name Hewlett-Packard  <br> Address 1000 N. E. Circle Boulevard  <br> City $\quad$ Corvallis State | Oregon | Zip Code 97330 |

## Program Description, Equations, Variables

The program uses least square technique to compute maximum likelihood estimator. By using the probability of survival $R\left(t_{i}\right)$
where:

$$
R\left(t_{i}\right)=\frac{N_{s}}{N_{o}}
$$

$$
\begin{aligned}
N_{s} & =\text { numbers survived at time } t_{i} \\
N & =\text { total number failed }
\end{aligned}
$$

$$
N_{0}=\text { total number failed }
$$

$\underset{\text { parameter }}{\operatorname{least} \text { square }} \lambda=-\frac{\sum_{i=1}^{n} t_{i} 1_{n} R\left(t_{i}\right)}{\sum_{i=1}^{n} t_{i}^{2}} ; \quad$ for detail see page 4 of 7
and $\hat{\theta}=\frac{1}{\lambda} ;$ maximum likelihood estimator

## Operating Limits and Warnings

This program has been verified only with respect to the numerical example given in Program Description II. User accepts and uses this program material AT HIS OWN RISK, in reliance solely upon his own inspection of the program material and without reliance upon any representation or description concerning the program material.
NEITHER HP NOR THE CONTRIBUTOR MAKES ANY EXPRESS OR IMPLIED WARRANTY OF ANY KIND WITH REGARD TO THIS PROGRAM MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. NEITHER HP NOR THE CONTRIBUTOR SHALL BE LIABLE FOR INCIDENTAL OR CONSEQUENtial damages in connection with or arising out of the furnishing, use or performance of this program MATERIAL.

DEVELOPING $\theta$ BY GENERATING THE PARAMETER $\lambda$ USING RELIABILITY FOR LEAST SQUARE METHOD

## Using Least Square Estimate

To Find value of parameter $\lambda$

$$
R\left(t_{i}\right)=e^{-\lambda t_{i}}
$$

$$
\ln R\left(t_{i}\right)=-\lambda t_{i}
$$

$s(\lambda)=\Sigma\left[\ln R\left(t_{i}\right)-\left(-\lambda t_{i}\right)\right]^{2}$
Now taking derivative w.r.t. $\lambda$ on both sides and equating to zero for maximum we get:

$$
\begin{aligned}
& \frac{d s(\lambda)}{d \lambda}=\Sigma^{2}\left[\ln R\left(t_{i}\right)+\lambda t_{i}\right]\left(t_{i}\right)=0 \\
& \sum 2\left[\ln R\left(t_{i}\right)+\lambda t_{i}\right]\left(t_{i}\right)=0 \\
& \Sigma 2\left[t_{i} \ln R\left(t_{i}\right)+\lambda t_{i}^{2}\right]=0 \\
& 2 \Sigma\left[t_{i} \ln R\left(t_{i}\right)+\lambda t_{i}^{2}\right]=0 \\
& \sum_{i=1}^{n} t_{i} \ln R\left(t_{i}\right)+\lambda \sum_{i=1}^{n} t_{i}^{2}=0 \\
& \lambda=\frac{-\sum_{i=1}^{n} t_{i} \ln R\left(t_{i}\right)}{\sum_{i}^{n} t_{i}^{2}}
\end{aligned}
$$

Sample Problem(s) Ten tires were put on testing machines with a known load and rpm. The test results of failures were as follows: FAILURE 非 OPERATING TIME

| Program Title | SYSTEMS RELIABILTY - SERIES AND PARALLEL WITH SAME |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| FAILURE RATE $\lambda$ |  |  |  |  |
| Contributor's Name Hewlett-Packard Company |  |  |  |  |
| Address 1000 N.E. Circle Boulevard |  |  |  |  |
| City | Corvallis | State Oregon | Zip Code | 97330 |

Program Description, Equations, Variables Program calculates total systems reliability when units (composed of differential components) are placed in series or parallel, by using the concept of unreliability to calculate systems reliability in parallel, avoiding very lengthy and tedious calculations. Saves considerable amount of time. Equations used are as follows:
$j_{i}$ is number of components of corresponding $\lambda_{i}$
$\lambda_{i}$ is failure rate/hr of differential components (say r types) (where $i=1,2,3$, ... r)
$\sum_{i=1}^{r} j i \lambda_{i}$; total failure rate/hr of a unit

$$
-\sum_{1}^{n} \lambda_{i} j_{i} \cdot t
$$

Unit $R_{S}(t)=e \quad$; Unit reliability for $t$ hours.
Unit $Q_{S}(t)=1-R_{S}(t)$; Unit unreliability for $t$ hours.

Series $Q_{\text {sys }}=1-R_{\text {sys }}$
Parallel $R_{\text {sys }}^{\prime}=1-\prod_{m=1}^{n} Q_{m}^{\prime}=\left[1-\left[1-\prod_{m=1}^{n}\left[R_{s}(t)\right]_{m}\right]\right.$

## Operating Limits and Warnings

All units placed in series or parallel must have same $\lambda$ failure rate per hour.

[^1]
## Sketch(es)

SERIES CONFIGURATION
PARALLEL CONFIGURATION

Sample Problem(s) The given electrical unit has following components with corresponding failure rates:

| chronological order i | $\begin{aligned} & \text { \# of } \\ & \text { components } \\ & \mathbf{j} \end{aligned}$ | $\varepsilon$ failure rate/hr/comp. $\lambda$ |  |
| :---: | :---: | :---: | :---: |
| 1 | 2-diodes | $2.0 \times 10^{-6} / \mathrm{hr}$ | $4.0 \overline{\times 10}^{-6} / \mathrm{hr}$ |
| 2 | 3-transistors | $10.0 \times 10^{-6} / \mathrm{hr}$ | $30.0 \times 10^{-6} / \mathrm{hr}$ |
| 3 | 1-eapacitor | $1.0 \times 10^{-6} / \mathrm{hr}$ | $1.0 \times 10^{-6} / \mathrm{hr}$ |
| 4 | 2-resistors | $2.0 \times 10^{-6} / \mathrm{hr}$ | $4.0 \times 10^{-6} / \mathrm{hr}$ |

Find for $t=1000$ hours; following:

1) Reliability, unreliability of a unit: $R_{S}(t) \& Q_{S}(t)$
2) Series reliability $R_{\text {sys }}$; unreliability for 3 units ( $n=3$ )
3) Parallel unreliability Qsys; reliability for 3 units ( $n=3$ )
4) Total failure rate/hour of an unit: ${\left.\underset{1}{r} \lambda_{i} j_{i}\right) ~}_{\text {) }}$

Solution(s) $\sum_{i=1}^{f} \lambda_{i} j_{i}=3.9000000 \quad-05$
Unit: $\quad R_{S}(1000)=0.961751 ; Q_{S}(1000)=0.038249$

Parallel System: $Q_{s}^{\prime}(1000)=0.000056 ; R_{s}^{\prime}(1000)=0.999944$
$\quad$ for $n=3$

Program Description I

Program Description, Equations, Variables
For series system, program uses $R_{s s}=\prod_{i=1}^{n} R_{i} \quad$ (where
 uses unreliability concept to find reliability of the system. $R_{s p}=1-Q_{s p}$ (where $Q_{s p}=\frac{n}{i=1}\left(1-e^{-\lambda_{i} t}\right) . \quad \lambda$ is failure rate/hour.

The program is very useful to check out any dependent failures, repairs, sand by operation and redundency of the system.

## Operating Limits and Warnings

This program has been verified only with respect to the numerical example given in Program Description II. User accepts and uses this program material AT HIS OWN RISK, in reliance solely upon his own inspection of the program material and without reliance upon any representation or description concerning the program material.
NEITHER HP NOR THE CONTRIBUTOR MAKES ANY EXPRESS OR IMPLIED WARRANTY OF ANY KIND WITH REGARD TO THIS PROGRAM MATERIAL, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. NEITHER HP NOR THE CONTRIBUTOR SHALL BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH OR ARISING OUT OF THE FURNISHING, USE OR PERFORMANCE OF THIS PROGRAM MATERIAL.

## Sketch(es)

SERIES SYSTEM
SERIES SYSTEM

## PARALLEL SYSTEM

Sample Problem(s) Two retro rockets of differnet capacities with failure rates $6 \times 10^{-6} \mathrm{~F} / \mathrm{Hr}$ and $23 \times 10^{-6} \mathrm{~F} / \mathrm{Hr}$ respectively of a command module of a spacecraft are to be mounted for maximum possible systems reliability for re-entry. Find out systems reliability for 1000 hours. If they are mounted in series or parallel. (Please refer to sketch above).
ie GIVEN: $\quad t=1000$
$\lambda_{1}=6 \times 10^{-6}$ Failures/hour
$\lambda_{2}=23 \times 10^{-6}$ Failures/hour

Solution(s)

$$
\begin{aligned}
& R_{s \mathrm{~S}}(1000)=\prod_{i=1}^{n} R_{i}=e^{-\lambda_{1} t} \cdot e^{-\lambda 2 t}=e^{-6 \times 10-6} \times 1000 \cdot e^{-23 \times 10-6 \times 1000}=0.97141 \\
& Q_{s \mathrm{~S}}(1000)=0.028584 \\
& R_{\mathrm{sp}}(1000)=1-Q_{s p}=\left[1-\left(1-R_{1}\right)\left(1-R_{2}\right)\right]=0.999864 \\
& Q_{s p}(1000)=\left(1-R_{1}\right)\left(1-R_{2}\right)=\left(1-e^{-\lambda_{1} t}\right)\left(1-e^{-\lambda_{2} t}\right)=0.000136
\end{aligned}

NOTES

## Hewlett-Packard Software

In terms of power and flexibility, the problem-solving potential of the Hewlett-Packard line of fully programmable calculators is nearly limitless. And in order to see the practical side of this potential, we have several different types of software to help save you time and programming effort. Every one of our software solutions has been carefully selected to effectively increase your problem-solving potential. Chances are, we already have the solutions you're looking for.

## Application Pacs

To increase the versatility of your fully programmable Hewlett-Packard calculator, HP has an extensive library of "Application Pacs". These programs transform your HP-67 and HP-97 into specialized calculators in seconds. Each program in a pac is fully documented with commented program listing, allowing the adoption of programming techniques useful to each application area. The pacs contain 20 or more programs in the form of prerecorded cards, a detailed manual, and a program card holder. Every Application Pac has been designed to extend the capabilities of our fully programmable models to increase your problem-solving potential.

You can choose from:
Statistics
Mathematics
Electrical Engineering
Business Decisions
Clinical Lab and Nuclear Medicine

## Users' Library

The main objective of our Users' Library is dedicated to making selected program solutions contributed by our HP-67 and HP-97 users available to you. By subscribing to our Users' Library, you'll have at your fingertips, literally hundreds of different programs. No longer will you have to: research the application; program the solution; debug the program; or complete the documentation. Simply key your program to obtain your solution. In addition, programs from the library may be used as a source of programming techniques in your application area.

A one-year subscription to the Library costs $\$ 9.00$. You receive: a catalog of contributed programs; catalog updates; and coupons for three programs of your choice (a $\$ 9.00$ value).

## Users' Library Solutions Books

Hewlett-Packard recently added a unique problem-solving contribution to its existing software line. The new series of software solutions are a collection of programs provided by our programmable calculator users. Hewlett-Packard has currently accepted over 6,000 programs for our Users' Libraries. The best of these programs have been compiled into 40 Library Solutions Books covering 39 application areas (including two game books).

Each of the Books, containing up to 15 programs without cards, is priced at $\$ 10.00$, a savings of up to $\$ 35.00$ over single copy cost.

The Users' Library Solutions Books will compliment our other applications of software and provide you with a valuable new tool for program solutions.

## RELIABILITY/QUALITY ASSURANCE

Calculations related to reliability/quality assurance are included in this book, e.g., intra-class correlation, specific compliance, parameter estimation, lower limit and bounds of reliability, failure of serves, leak rate, maximum likelihood estimator, system reliability, distribution function, comparison of hazard models, etc.

RELIABILITY: INTRA-CLASS CORRELATION

## SPECIFICATION COMPLIANCE FROM LIMITS AND REGRESSION ANALYSIS

PARAMETER ESTIMATION (EXPONENTIAL DISTRIBUTION)
LOWER LIMIT OR RELIABILITY - BINOMIAL DISTRIBUTION
RELIABILITY AND PROBABILITY OF FAILURE OF SERIES AND PARALLEL SYSTEMS
MIL - STD - 883 CALCULATED LEAK RATE
MLE: $\hat{\theta}$ FROM HAZARD RATE
MLE: $\hat{\theta}$ BY LEAST SQUARE METHOD
SYSTEMS RELIABILITY-SERIES AND PARALLEL WITH SAME FAILURE RATE $\lambda$
SYSTEMS RELIABILITY-SERIES AND PARALLEL WITH DIFFERENT FAILURE RATE $\lambda$
