    - Cross Reference
    - Hex Dump Of Code
- 5 SOURCE MODULES IN ADDRESS ORDER

INTRODUCTION	CHAPTER 1
--------------	-----------

This volume contains the complete source code listings for the HP-71 HP-IL Module. The program modules which comprise the 16K-byte ROM are presented here in address order according to their position in the ROM, from lowest address to highest address. For purposes of presentation the modules are assembled relative to a ROM starting address of F0000 hex. In actuality the ROM is soft-configurable, and may be automatically configured by the HP-71 to other sections of the address space.

The following sections give a list of the program module names in address order, followed by an alphabetical list of the module names. A module's source file is denoted with an ampersand (&) in the file name, and its object (binary) file with a percent sign (%) in the file name.

Interface information to an entry point or poll is described in a documentation header in the source file that contains that entry point or handles that poll. In this version of this document, supported entry points are not yet indicated in the source listings as they are in the HP-71 operating system source listings. However, the poll interfaces and certain entry point interfaces will be supported.

It is the intent of HP to preserve such supported interfaces, as well as the absolute address position of each supported entry point, through any future updates of the HP-71 HP-IL Module. In general this allows external software which uses these interfaces to work predictably without regard to the version of the HP-71 HP-IL Module with which it is run. However, HP reserves the right to adjust the supported interfaces in any manner it chooses.

LIST OF MODULES IN ADDRESS ORDER	CHAPTER 2
----------------------------------	-----------

Address Range	Module	Title
NZRST	F0000 - F0007	ROM Start (Header)
NZTBL	F0008 - F0409	Lexical Analyzer Tables--ID=FF
NZERR	F040A - F06B4	Error Message Table
NZDIR	F06B5 - F07C1	Directory Section
NZGPR	F07C2 - F0F99	General Routines
NZBAS	F0F9A - F1F33	BASIC Routines
SCENT	F1F34 - F2C95	ENTER Execution
NZUTL	F2C96 - F2ED6	User Utility Routines
NZBIF	F2ED7 - F362D	Basic interface
NZIOB	F362E - F3636	I/O Buffer Routines
NZDSP	F3637 - F3BF6	Display Driver
NZBUT	F3BF7 - F4292	BASIC Utilities
NXCAS	F4293 - F511A	Cassette Routines
NXHND	F511B - F5E90	Poll Handlers
NXCAT	F5E91 - F66D1	HP-IL CAT
NZIOR	F66D2 - F68D7	I/O (NEW Mailbox)
NZFRA	F68D8 - F6D55	HP-IL Frame Routines
NZLOW	F6D56 - F6E18	Low-level User HP-IL
NZFXQ	F6E19 - F74FC	File Execution
NZPAR	F74FD - F78D2	HP-IL Parse Routines
NZDEC	F78D3 - F7EFO	HP-IL Decompile Routines
SZRRT	F7FFC - F7FFD	Zero File - ROM Checksum
SZRRT	F7FFE - F7FFF	Zero File - End of chain
NZSYM	No Address	Symbolic Assignments

LIST OF MODULES SORTED BY MODULE NAME	CHAPTER 3
---------------------------------------	-----------

Module	Address Range	Title
NZXBAS	F0F9A - F1F33	BASIC Routines
NZXBIF	F2ED7 - F362D	Basic interface
NZXBUT	F3BF7 - F4292	BASIC Utilities
NZXCAS	F4293 - F511A	Cassette Routines
NZXCAT	F5E91 - F66D1	HP-IL CAT
NZXDEC	F7BD3 - F7EFO	HP-IL Decompile Routines
NZXDIR	F06B5 - F07C1	Directory Section
NZXDSP	F3637 - F3BF6	Display Driver
NZXERR	F040A - F06B4	Error Message Table
NZXFRA	F6BD8 - F6D55	HP-IL Frame Routines
NZXFQ	F6E19 - F74FC	File Execution
NZXGPR	F07C2 - F0F99	General Routines
NZXHND	F511B - F5E90	Poll Handlers
NZXIOB	F362E - F3636	I/O Buffer Routines
NZXIOR	F66D2 - F6BD7	I/O (NEW Mailbox)
NZXLOW	F6D56 - F6E18	Low-level User HP-IL
NZXPAR	F74FD - F7BD2	HP-IL Parse Routines
NZXKST	F0000 - F0007	ROM Start (Header)
NZXSYM	No Address	Symbolic Assignments
NZXIBL	F0608 - F0409	Lexical Analyzer Tables--ID=FF
NZXUTL	F2C96 - F2ED6	User Utility Routines

25     **
26     ** Name:      hENTER - Poll handler for the pENTER poll
27     **
28     ** Category:  POLL
29     **
30     ** Type:      POLL
31     **
32     ** Purpose:
33     **           To read data from HP-IL and put it on math stack
34     **
35     ** Entry:
36     **           B[A] = Poll number.
37     **           MEX mode.
38     **           P=0.
39     **           MTHSTK=FORSTK (Math stack is collapsed to FORSTK)
40     **
41     **           R1[A]=HP-IL address (device's location relative to the
42     **                   controller)
43     **
44     **           S5 (BytCnt):
45     **               1:Read a specified number of characters
46     **                   A[A] is the number of characters to read
47     **               0:Terminate by END frame or terminating char match
48     **                   A[B] is the terminating character
49     **
50     **           S6 (Trash):
51     **               1:Ignore the data which is read
52     **               0:Save the data which is read on the stack
53     **
54     **           S7 (ChrTrp):
55     **               1:Detect a special character in incoming data

```

```

56      **          R2[B] is the character to be detected
57      **          If R2[3:2]=00, ignore the character;
58      **          otherwise replace the character with R2[3:2]
59      **          0:No special character processing
60      **
61      **          If system flag -23 is set:
62      **          Terminate by ETO, terminating character is ignored
63      **
64      **          If S5 (BytCnt)=0, S6 (Trash)=0, and S-R0-3[0]>2 (the
65      **          destination is a string), then S-R1-1[3:0] and R3[A]
66      **          are the maximum number of chars to read before
67      **          interrupting the conversation with an NRD.
68      **          R3[S] must not be "F". (R3[4]=0)
69      **
70      **          If S5 (BytCnt)=1 or S6 (Trash)=1, then flag -23 has
71      **          no effect other than to terminate on an ETO instead
72      **          of the terminator character.
73      **
74      **          If { S-R0-3[0]<=2 (not string dest) and S5 (BytCnt)=0 }
75      **          or { in device mode (not controller) },
76      **          then flag -23 has no effect (it is ignored).

2648 **
  
```

```

2649 ** History:
2650 **
  
```

Date	Programmer	Modification
02/22/84	NZ	Changed GOSUB FNDCHK to GOSUBL
12/20/83	NZ	Installed fix for SR #0039-1075(1) The fix involves moving the call to GLOOPM to the calling routine to save one RSTK level, then calling GETARG
12/19/83	NZ	Added documentation
	SC	Wrote routine

```

16         **
17         ** Category:     POLL
18         **
19         ** Purpose:
20         **      Execute the CAT function for an HPIL device
21         **
22         ** Entry:
23         **      File name in A[W], RO[3:0] (A[W]=0 if none specified)
24         **      Device specifier in D[3:0], D[S]
25         **      P=0
26         **
27         ** Exit:
28         **      P=0
29         **      Carry set: error (C[3:0] is error number)
30         **      Carry clear:
31         **      XN=0: handled (cat is finished)
32         **      XN=1: not handled (not HPIL or not HP82161)
33         **
34         ** Calls:        CKBITL, FINDF+, SAVED1, SETCAT, BLDCAT, DSPCAT, BF2DSP,
35         **                RESTD1, START, GETDR!, hCATsu, CK=ATn, UTLEND, POPBUF,
36         **                RPTKY, SCRLLR, FINDA, D1=AVE, ENDTAP, hCTA+, hCTA-,
37         **                CSRC10, NXTENT, hCTA=, CSRC5, LSTENT, CSLC10, CSLC5
38         **
39         ** Uses.....
40         **      Inclusive: A, B, C, D, RO, R1, R2, R3, R4, DO, D1, P, STMTDO, ST[4:0],
41         **                SCRATCH[63:0], 3 RSTK save fields, FUNCDO, FUNCRI,
42         **                F-RO-1
43         **
44         ** Stk lvs:      6 (FINDF+)(hCTA+)(hCTA-)(hCTA=)
45         **
46         ** Detail:
47         **      R3 contains the pointers to the current drive:
48         **      [A] is the # of entries remaining in directory
49         **      (after the current one!), including any
50         **      purged entries
51         **      [9:5] is the current entry number (this is the
52         **      number of entries to here in the directory,
53         **      including the current entry and any purged
54         **      entries)
55         **      [13:10] is the physical directory pointer (3 nib
```

```

56      **      record pointer, 1 nib offset pointer)
57      **
58      **      [S] is the "valid" flag - indicates whether
59      **      the physical directory pointer is where the
60      **      drive really is pointing now (0 means valid)
61      ** Algorithm:
62      **
63      **      hCAT: IF (not MPIL) or (not MP82161) THEN
64      **              RETURN carry clear, XM=1 -- Not handled

35         ** Name:      READIT,READSU - Read into RAM from loop
36         **
37         ** Category:  PILI/O
38         **
39         ** Purpose:
40         **      Read data, given a buffer to put it into, and a count
41         **      of how many bytes to enter
42         **
43         ** Entry:
44         **      D0 points to mailbox
45         **      D1 points to the input buffer
46         **      A[A] is the number of bytes to read
47         **      A[5] is the conversion type for I/O CPU
48         **
49         **      READSU: C[5:0] is start message and count
50         **      READIT: the conversation is started
51         **
52         ** Exit:
53         **      Carry clear: D1 points past the last character
54         **      A[A] is zero
55         **      Carry set:  Error...A[A] is the number of bytes left
```

```

56      **          in the buffer
57      **          If P= =ePIL, C[6:0], [S] is status msg
58      **          from I/O CPU ([S] has been doubled)
59      **          Else C[W] is undefined
