## PPC ROM POCKET <br> GUIDE

## KEYBOARD FUNCTIONS (Default Assignments)

## BD

## FI

CA

FR

CV

IG

This Pocket Guide is the short form of the 500-page ROM Users Manual. This, the HEX Card and the PPC ROM are available at PPC.
PPC, the Personal Programming Center, publishes a monthly 48-page joint computer/calculator journal. PPC is a California non-profit public benefit corporation dedicated to the advancement and application art of personal programming.
PPC is the oldest, most experienced worldwide users group of personal programmers having printed more than 15 million pages on personal programming calculators and computers.

Each routine has an abbreviated Technical Details box. Abbreviations used in this box are:

| S: SIZE | A: Alpha Registers |
| :--- | ---: |
| R: Registers Used | m: Minimum |
| F: Flags Used | A/R: As Required |
| SL: Subroutines Left | N/A: Not Applicable |
| C: Registers to Copy | (R): All Flags Restored |

*Maximum pending RTN's when routine is called.

May be used after MK (which will set flag 20 and clear 07) or after IK (which will set both flags 20 and 07 ). The sequence prefix ENTER postfix ENTER keycode, XEQ +K will make the corresponding key assignment. If flag 07 is clear, it will then prompt for subsequent key assignments; otherwise it returns after making only one assignment. Both $\mathbf{1 K}$ and $\mathbf{+ K}$ permit key assignments under program control. Note that the sequence CF 20, SF07, XEQ +K is completely equivalent to XEQ ${ }^{\top}$. Do not use data registers 09-11 between uses of $\boldsymbol{+ K}$. Not interruptible. Disrupts I/O Buffer (Timer Alarms), see warning under LT.

$$
\text { S: } 012 \text { R: 6-11, A F: 7-10, 20, } 25 \text { SL: } 3 \text { C:61 }
$$

[ - must be used for initialization of the byte-loading process. With a decimal code of the byte to be loaded in X, XEQ -B. Will load the corresponding byte into the next available location after LBL " + +". CF 09 to terminate byte loading with prompting for clean up operations. CF 08 to switch to manual byte loading.

$$
\begin{array}{lllll}
\text { S: } 012 & \text { R: 6-11, A } & \text { F: 8, 9, } 29 & \text { SL: } 4 & \text { C: } 71
\end{array}
$$

A non-prompting key assignment program. The sequence prefix ENTER postfix ENTER keycode, XEQ IK, will make one key assignment. For more assignments, see $\mathbf{+ K}$. Not interruptible. Disrupts I/O Buffer (Timer Alarms), see warning under LFI.

$$
\text { S: } 012 \text { R: 6-11, A F: 7-10, 20, } 25 \text { SL: } 3 \quad \text { C: } 61
$$

Evaluates the decimal equivalents for the last two bytes in $X$. Returns the decimal equivalent for the next-to-last byte in $X$, for the last byte in $M$. (Use $X<>M$ to view.) $\mathrm{Y}, \mathrm{Z}$ preserved.

$$
\begin{array}{lllll}
\hline \text { S: } 000 & \text { R: A } & \text { F: None } & \text { SL: } 6 & \text { C: } 60
\end{array}
$$

## A? - ASSIGNMENT REGISTER FINDER ? XROM 10,10

Returns the number of assignment registers used. Key assignments by ASN may give a register count $1 / 2$ too high. If timer alarms are present they will be disrupted and file count will be inaccurate. See alarm warning under LF.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 10 & \text { SL: } 3 & \text { C: } 59
\end{array}
$$

## AD - ALPHA DELETE LAST CHARACTER XROM 10,18

Removes the last (rightmost) character from the alpha register. There must be no nulls in the string. $L$ is preserved.

| S: 000 | R: A | F: None | SL: 6 | C: 64 |
| :--- | :--- | :--- | :--- | :--- |

## AL - ALPHABETIZE X AND Y

 XROM 10,37Sorts two alpha strings in X and Y in alphabetic order (upon return lower value in X ). If X and Y are numeric, they are regarded as pointers to two data registers which are to be sorted, the lower value to the register designated by $X$. Flag 10 is left set or clear to indicate whether an interchange was performed or not.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 10,25 & \text { SL: } 4 & \text { C: } 63
\end{array}
$$

## AM - ALPHA TO MEMORY

ASTOres then clears all or part of contents of the ALPHA register into data registers using an ISG control number in X of the form bbb.eeeii. Inverse operation is MA. (not synthetic)

$$
\text { S: 004m R: A/R A F: None } \quad \text { SL: } 5 \quad \text { C: } 16
$$

Ab provides an ASTO b with the ROM-mode interpretation, permitting ultra-fast ROM entry as an alternative to XE.
In ROM the mode of interpreting the last two bytes of status register $b$ (which comprise the program pointer) is different than when in RAM. In ROM the first nibble specifies a 4 k page of ROM, and the last 3 nibbles specify an address within that page. In RAM the first nibble $(\bmod 8)$ specifies a byte within a register specified by the last 3 nibbles ( $\bmod 1024$ ).
Stack is preserved.

$$
\text { S: } 000 \text { R: None } \quad \text { F: None } \quad \text { SL: } 0 \quad \text { C: } 60
$$

## BA - BARCODE ANALYZER

XROM 20,30
Prompts for wand scan of barcode. Prints tabular analysis of barcode including type, with every byte in binary, hex, decimal, and the printer character ( $<128$ ). Computes and prints checksum if $>2$ bytes.

$$
\text { S: } 019 \text { R: 0-18, A F: 7-10, 12, } 21 \text { SL } 4 \text { C: } 49
$$

BC - BLOCK CLEAR
XROM 20,43
Stores 0's in defined block using an ISG control number bbb.eeeii in X . $\mathrm{Y}, \mathrm{Z}$, and T are preserved.

| S: A/R R:A/R F: None | SL: $5 \quad$ C: 61 |
| :--- | :--- | :--- | :--- |

BD - BASE B TO BASE DECIMAL
XROM 20,17
Store base b in RO6 ( $2<=\mathrm{b}<=25$ ). Input up to 14 digits of base b number in alpha (each digit must be less than b) and XEQ BD. The base 10 result is left in $X$ and alpha is cleared. The inverse routine is TB. Keyboard function A will XEQ ED after positioning to $\mathbf{B D}, \mathrm{TB}, \mathrm{PM}, \mathrm{CM}, \mathbf{C J}$, or $\boldsymbol{J C}$.

$$
\begin{array}{lllll}
\text { S: } 007 & \text { R: } 6, \mathrm{~A} & \text { F: None } & \text { SL: } 5 & \text { C: } 53
\end{array}
$$

## BE - BLOCK EXCHANGE

XROM 20,34
Input two ISG block control numbers bbb.eeeii in X and Y and XEQ BE. For two blocks not of the same size, note that the
block control number in Y is tested and controls the loop. $\mathrm{Z}, \mathrm{L}$ are preserved.

| S: A/R | R: A/R | F: None | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

## B】 - BLOCK INCREMENT

XROM 20,34
Stores numerical data (as a sequence, constant, or zero) in a block of registers. Input:

Z: Control word (bbb.eeeii)
Y: Starting Data Value
X: Data Increment Value
bbb.eeeii ENTER
Start value ENTER
Increment value
XEQ
$\mathrm{X}, \mathrm{T}$ are preserved in $\mathrm{L}, \mathrm{T}$.

$$
\begin{array}{lllll}
\text { S: A/R } & \text { R: None } & \text { F: None } & \text { SL: } 5 & C: 46
\end{array}
$$

## BL - BLDSPEC INPUTS FOR LB

XROM 10,42
Converts seven BLDSPEC numbers into seven decimal byte numbers for a synthetic text line. Key first BLDSPEC number, XEQ EBL . See corresponding byte in X (0-255). Key second BLDSPEC number, R/S, see second byte. Continue with R/S until all seven bytes are obtained. To use LB start with 247, followed by seven bytes. To print: Text line, RCL M, ACSPEC, PRBUF. Related routines are $\boldsymbol{F L}$ and XL. These are not intended to be used as subroutines.

| S: 000 | R: M, N, O | F: None | SL: N/A | C: 46 |
| :--- | :--- | :--- | :--- | :--- |

## BM - BLOCK MOVE

Moves a block of consecutive registers into another block of consecutive registers. Input:
Z: 1st register number in source block
$Y$ : 1st register number in destination block
$X$ : Number of registers in block

$$
\text { S: A/R R: None } \quad \text { F: None } \quad \text { SL: } 5 \quad \mathrm{C}: 61
$$

## BR - BLOCK ROTATE

Rotates the content of data in a block of consecutive registers.

Input:
$\mathrm{Y}: \quad$ 1st register number of block
X: $\pm$ number of registers in block
If $X>0$ the block shifts to higher numbered registers
If $X<0$ the block shifts to lower numbered registers
Each call to BR shifts by one register.

| S: A/R | R: A/R | F: None | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

## BV - BLOCK VIEW

XROM 20,07
Allows viewing (or printing if able) of non-zero register contents of a block defined using a control word bbb.eeeii in X. Set flag 09 to PSE at each register. Set flag 10 to stop at each register.

$$
\text { S: A/R } \quad \text { R: A/R } \quad \text { F: } 9,10,21,25,29 \quad \text { SL: } 4 \quad \text { C: } 40
$$

## BX - BLOCK EXTREMA

XROM 20,41
Finds the maximum or minimum of a block of registers defined using a control word bbb.eeeii in X . Set flag 10 to use absolute values. Output:
M: INT part is max value register number
N : INT part is min value register number
O: Original block control word
Y: Max value of block
X: Min value of block

$$
\begin{array}{|ccccc|}
\hline \text { S: A/R } & \text { R: M,N,O } & \text { F: } 10 & \text { SL: } 5 & \text { C: } 61 \\
\hline
\end{array}
$$

## BE - BLOCK STATISTICS

XROM 20,42
Calculates statistical sums for two register blocks defined by control words bbb.eeeii in X and Y. For two blocks not of the same size the block control word in $Y$ controls the loop. Output in $\Sigma$-registers:
$\Sigma x \Sigma x^{2} \Sigma y \Sigma y^{2} \Sigma x y n=\# r e g$. in block

| S: A/R | R: $\Sigma R E G \quad F:$ none | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

Create this function using LEB or $\mathbf{M K}$ inputs 162,128 . Use this function to determine if PPC ROM is present. It has no effect if present, gives NON EXISTENT or clears flag 25 if absent.

| S: 000 | R: none | F: 25 | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

Returns the absolute decimal address of R00 (curtain location). $\mathrm{X}, \mathrm{Y}$ preserved in $\mathrm{Y}, \mathrm{Z}$.

$$
\text { S: } 000 \text { R: A } \quad \text { F: (R) } \quad \text { SL: } 6 \quad \text { C: } 64
$$

## CA - COMPLEX ARITHMETIC

XROM 20,23
GTO CA and XEQ 06 to initialize the complex stack. The keyboard functions are:
$a: X<>Y$
b: $Y^{X}$
c: Pop
d: Last Z
e: $e^{z}$

| A: + | B: - | C: $\times$ | D: $\div$ | E: $\ln (z)$ |
| :--- | :---: | :---: | :---: | :---: |
| Initialize (XEQ 06) | H: $\sin (z)$ | I: $\cos (z)$ | J: Push |  |

Register usage:

R06: function \#
R07: Last $Z$ (IM)
R08: Last $Z$ (RE)
R09: Ptr to Stk

R10: Start of Stack
R11: Start of Stack
!
Reven $=\mathbf{Z}$ (IM)
Rodd $=Z$ (RE)

RAD mode must be used.
Store call \# in R06 and XEQ CA
1: + 2: - $3: \times \quad 4: \div \quad$ 5: $\ln (z) \quad$ 6: Init. Stack 7: $\cosh (y), \sinh (y) \quad$ 8: $\sin (z) \quad 9: \cos (z) \quad$ 10: PUSH 11: $X<>Y \quad$ 12: $Y^{x} \quad$ 13: POP 14: Last $Z \quad$ 15: $e^{Z}$ 16: POP(save Last $Z$ )

$$
\begin{array}{lllll}
\text { S: } 018 \mathrm{~m} & \text { R: 6-17+,M, } & \text { F: } 10 & \text { SL: } 4 & \text { C: } 38
\end{array}
$$

## CB - COUNT BYTES

Counts bytes between any two instructions in RAM after placing their program pointers in X and Y . The count includes the first instruction, but not the last. Obtain program pointer with RCL b when positioned at the instruction in RUN mode. Also, the decimal address of the first pointer returns in Y , the last pointer's returns in L. Note that an END adds 3 to the byte count. A program byte count divided by 112 and rounded up to the nearest integer yields the number of tracks required to record the segment on magnetic cards. (RCL $b=144,124$, key)

$$
\begin{array}{lllll}
\hline \text { S: } 000 & \text { R: A } & \text { F: None } & \text { SL: } 4 & \text { C: } 60
\end{array}
$$

Decodes last byte of alpha register (rightmost character displayed) into a decimal number returned in X. Up to 14 characters (the rightmost 14) will be preserved in the alpha register, including the decoded character if flag 10 is set. Otherwise the decoded character is deleted. $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ preserved in $\mathrm{Y}, \mathrm{Z}, \mathrm{T}$.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 10 & \text { SL: } 6 & \text { C: } 60
\end{array}
$$

## CJ - CALENDAR DATE TO JULIAN DAY XROM 20,21 NUMBER

Clear flag 10 for Gregorian (modern) calendar. Set flag 10 for Julian calendar. The keyboard function E will XEQ CJ after positioning to [BD, TB, PM, CM, CJ, or JC . Valid from March 1, 0 AD (1BC). Input date in format:
$Z$ : year The JDN is returned in $X$.
Y: month DOW $=(J D N+1)$ MOD $7 \quad(S U N=0)$
$X$ : day The inverse routine is IJC

| S: 000 | R: None | $F: 10$ | SL: 5 | C: 53 |
| :--- | :--- | :--- | :--- | :--- |

## CK-CLEAR KEY ASSIGNMENTS XROM 10,06

All USER mode assignments revert to the standard keyboard. Assignment registers become free registers. Global label assignments are dormant until the next program or status card is read in. X is preserved. Clears I/O buffers (Timer Alarms).

$$
\begin{array}{llll}
\text { S: } 000 & R: A & \text { F: (R) } & \text { SL: } 4
\end{array} \text { C: } 59
$$

## CM-cOMBINATIONS

XROM 20,20
To compute $\mathrm{C}(\mathrm{n}, \mathrm{k})$ : n ENTER k XEQ CM. The number of combinations of $n$ objects taken $k$ at a time is left in $X$. The keyboard function D will XEQ CM after positioning to [BD, TB, PM, CM, CJ, or JC.

| S: 000 | R: None | F: None | SL: 5 | C: 53 |
| :--- | :--- | :--- | :--- | :--- |

## CP - COLUMN PRINT FORMATTING XROM 20,27

Aligns numeric values for printing columns of data. A skip index keeps decimal points in place and is calculated as (Max \# digits
left of dec. pt.) -1 for F29 clear, and (Max \# digits . . .) $-1+$ (No. commas in largest number in the column) for F29 set. Set display mode, status of F29, place skip index in R06, place the number in $X$ and XEQ CP. The number will then be added to the buffer in the correct column position.

$$
\begin{array}{lllll}
\hline \text { S: } 007 & \text { R: } 6 & \text { F: None } & \text { SL: } 5 & \text { C: } 29
\end{array}
$$

## CU - CURTAIN UP

Adds the signed integer value of the contents of $X$ to the ROO pointer (in status register c). The sequence 10 , XEQ CU raises the curtain 10 registers. Then the sequence -10, XEQ CU lowers it to its previous position. $\mathrm{Y}, \mathrm{Z}$ preserved in X, Y; $\Sigma$-reg absolute location is unchanged. Not interruptible with printer. See important warnings under CX.

$$
\text { S: } 000 \text { R:A } \quad \text { F: (R) } \quad \text { SL: } 6 \quad \text { C: } 60
$$

## CV - cuRVE FIT

GTO CV and the keyboard functions are:
a: $\Sigma-$
e: Initialize
A: $\Sigma+$
B: Solve Type j
C: $\hat{Y}$
D: $\hat{X}$
E: Solve Best

Curve Types:

1. Linear
$y=b x+a$
2. Exponential
$y=a e^{b x}(a>0)$
3. Logarithmic
$y=b L N(x)+a$
4. Power
$y=a x^{b}(a>0)$
Key $x$ ENTER $y$ and press $A$ for each data pair.
Key B returns: . X: b Y: a Z: r
Key E returns: X: $j \quad Y: b \quad Z: a \quad$ T: $r$
R06: fct. \#
R07: cv type
R08: b, $x$
R09: $\mathrm{a}, \mathrm{y}$
R10: $r$
R11: $\Sigma x \ln (y)$
R13: $\Sigma x$
R14: $\Sigma x^{2}$
R20: $\Sigma \ln (x)^{2}$
R21: $\Sigma \ln (y)$
R15: $\Sigma y \quad$ R22: $\Sigma \ln (y)^{2}$
R16: $\Sigma y^{2} \quad$ R23: $\Sigma \ln (x) \ln (y)$
R17: $\Sigma x y$
R18: $\Sigma n$
R19: $\Sigma \ln (\mathrm{x})$
Store call \# in R06 and XEQ CV
0:clear/init. 1: $\Sigma+$
2: solve type j
3: $\hat{Y}$
$4: \hat{X}$
5: Solve Best Type 6: $\Sigma$-(when F10 set) 9: stop in CV

| S: 027 | R: 6-26 | F: 8-10 | SL: 4 | C: 42 |
| :--- | :--- | :--- | :--- | :--- |

## CX - CURTAIN TO DECIMAL ADDRESS XROM 10,33

 IN XPlaces hex version of X into the appropriate 3-nibble slot (the pointer to ROO) in status register c. WARNING: Values 17 through $192(\bmod 1024)$ or greater than $512(\bmod 1024)$ may result in "MEMORY LOST.' Y preserved in X, Y; T contains old c. $\Sigma$-reg absolute location is not changed. Not interruptible if printer is attached.

$$
\begin{array}{lllll}
\text { S: } 000 & R: A & \text { F: (R) } & \text { SL: } 5 & \text { C: } 60
\end{array}
$$

## DC - DECIMAL TO CHARACTER

XROM 10,11
Similar to Extended Functions XTOA. Appends to alpha contents the character corresponding to the decimal integer ( $\bmod 256$ ) in $X$. $\mathrm{Y}, \mathrm{Z}$ preserved in $\mathrm{X}, \mathrm{Y}$; ( L contains old $\mathrm{X}+256$ ).

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: (R) } & \text { SL: } 6 & \text { C: } 59
\end{array}
$$

## DF - DECIMAL TO FRACTION

Store display accuracy (0-9) in R07. Input decimal in X and XEQ DF. Reduced fraction is left in $Y$ (numerator) and $X$ (denominator). In addition, if flag 10 was set, the fraction is displayed in alpha. The keyboard function d will XEQ DF after positioning to ER, DF, NP, GN, or ENN.

$$
\text { S: } 011 \text { R: 7-10, (A) F: 10,25 } \quad \text { SL: } 4 \text { C: } 36
$$

## DP - DECIMAL TO PROGRAM POINTER XROM 10,53

The inverse to PD. Converts a decimal byte address in X to a RAM program pointer that via a STO b (be sure to return to RAM first!) can resume program operation where desired. See $\mathbf{A b}$ regarding program pointers. Byte addresses begin with 0 at the bottom of status register memory through 111; this is followed by a 'hole' from 112 to 1343; then follows user memory from 1344 to 3583 (for the full complement of user registers). Y is preserved.

| S: 000 | R: A | F: None | SL: 5 | C: 60 |
| :--- | :--- | :--- | :--- | :--- |

Store:
R07: 1st register of entire file
R08: number of registers per record
R09: number of records in the file.
To delete the kth record, input $k$ in $X$ and XEQ DR. R09 is automatically updated. Inverse routine is IRT.

| S: 010 m | R: None | F: None | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

## DS - DISPLAY SET

 XROM 10,29If $\mathrm{FIX}, \mathrm{SCI}$ or ENG n is set then keying m XEQ DS changes the display mode to FIX, SCI, or ENG m. X, Y, Z, T are preserved in L, X, Y, Z.

| S: 000 | R: A | F: None | SL: 6 |
| :--- | :--- | :--- | :--- |
| C: 60 |  |  |  |

## DT - DISPLAY TEST

XROM 10,17
Turns on all 12 commas for 1 PSE (execution can be interrupted only at this point), then all display segments and annunciators except for the comma tails. Review the display, then push the PRGM switch and R/S to clean up. X, Y, and $Z$ are preserved.

| S: 000 | R: A | F: (R) | SL: $6 \quad$ C: 64 |
| :--- | :--- | :--- | :--- |

## E? - END. FINDER ?

XROM 10,62
Returns the absolute decimal address of the register containing the .END. in its last 3 bytes (bytes 02-00) by decoding the appropriate pointer digits in status register c . $\mathrm{X}, \mathrm{Y}$ preserved in $\mathrm{Y}, \mathrm{Z}$.

| S: 000 | R: A | F: None | SL: 5 |
| :--- | :--- | :--- | :--- |

## EP - ERASE PROGRAM MEMORY

XROM 10,31
As long as flag 14 is clear and there is a program labeled " $/ l$ " (as described below) in RAM, XEQ EPP will clear programs following that labeled "I I."

> LBL "/ /"
> RCL b
> END or RTN
(followed by at least 6 bytes before .END.)

If flag 14 is set or if there is no program "/ /" as described, all programs will be erased. XEQ EP should be followed by PACK to reinstate CATalog 1.
If keyboard assigned global labels are erased by EP , use ASN to clear keys, or read any program or status card. X is preserved.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 14,25 & \text { SL: } 0 & \text { C: } 60
\end{array}
$$

## EX - EXPONENT OF X

XROM 10,27
Replaces $X$ by its exponent portion, -99 to +99 . The old $X$ is saved in $\mathrm{L} ; \mathrm{Y}, \mathrm{Z}$, and T are preserved.

$$
\text { S: } 000 \text { R: A F: None SL: } 6 \text { C: } 60
$$

## F? - FREE REGISTER FINDER ?

Returns the number of free (available) registers between the last used assignment register and the .END. register. There will be a non-zero fractional part 0.5 and flag 10 will be set whenever the top assignment register contains only a single assignment in the left half of the register. See PK. If I/O buffers (like Timer Alarms) are present they will be disrupted and the count will be inaccurate. See warnings under LFI.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 10 & \text { SL: } 3 & \text { C: } 61
\end{array}
$$

## FD - FIRST DERIVATIVE

XROM 20,11
Calculates $f^{\prime}(X)$. Store the following:
R10: global label name of function
R11: pointer to register containing $X$ (function input)
R12: step size
Flag 09 set selects quick approximation. F09 clear selects adaptive procedure. If F09 is clear, set F10 to view convergence. Estimate of first derivative is left in X and if F 09 is clear an error estimate is left in Y. Maximum accuracy is $61 / 2$ digits. The keyboard function D will XEQ FD after positioning to IG, SV, or FD.

| S: 018 | R: $10-17$ | F: 9,10 | SL: 4 | C: 43 |
| :--- | :--- | :--- | :--- | :--- |

GTO FI and the keyboard functions are:
a: $12 x$
b:12 $\div$
c: C/D?
d: B/E?
e: Clear
A: n
B: \% i
C: PV
D: PMT
E: FV
H:CF I: PF
J : Status

Register usage:
R01 through R05 hold the values defined by the keys above, plus R06: Fcn call \#, R07: \% i as decimal. F08 set/clear = C/D. F09 set/clear = B/E. Set F10 to view convergence when solving for $\% i$. Accuracy for $i$ is set by display mode.

Store call \# in R06 and XEQ FI

| 0:clear/init. | 1:solve $n$ | 2:solve \%i | 3:solve PV |  |
| :--- | :---: | :---: | :---: | :---: |
| 4:solve PMT | 5:solve FV | 12:stop in |  |  |

| S: 010 | R: 1-9, M | F: 8-10 | SL: 4 | C: 47 |
| :--- | :--- | :--- | :--- | :--- | :--- |

## FL - FLAG INPUTS FOR LB

XROM 10,43
Provides the seven decimal numbers for a synthetic text line from the flags set inputs. To use XEQ FL , key first flag set, R/S. If $X$ is negative, key next flag, R/S. If TONE sounds, record byte number, R/S. Key flags set in order of lowest to highest. Use 56 as last input if required. To use LB start with 247, followed by seven bytes. In a program use sequence: Text line, RCL M, STO d. Related routines are BL and XL.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: None } & \text { SL: } 4 & \text { C: } 46
\end{array}
$$

## FR - FRACTIONS

XROM 20,12
GTO FR and the keyboard functions are:

| a: GN | b: $\mathbf{R N}$ | c: GCD | d: DF | e: NP |
| :--- | :--- | :--- | :--- | :--- |
| A: + | B: - | C: $\times$ | D: $\div$ | E: Reduce |

Set F10 and clear F29 to display fractional forms in alpha.
Store call \# in R06 and XEQ FR
1:+ 2:- $3: \times \quad 4: \div \quad$ 5: Reduce $Y / X \quad$ 6:GCD $(x, y)$

| S: 000 | R: None | $F: 10,25$ | SL: 4 | C: 36 |
| :--- | :--- | :--- | :--- | :--- |

## GE - GO TO .END.

XROM 10,60
GE provides a handy way to move out of ROM back to RAM by placing the program pointer at line 00 of the program file
that contains the .END. of program memory. $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, \mathrm{L}$ are preserved.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: }(R) & \text { SL: } 0 & \text { C: } 60
\end{array}
$$

## GN - GAUSSIAN RANDOM NUMBER GENERATOR

XROM 20,15

Input:
R06: Mean of distribution
R07: Standard deviation of distribution
X: Pointer to register with seed.
Generates two random numbers (in X and Y ) with Gaussian distribution. Use DEG mode, X is preserved in Z , T . The keyboard function b will XEQ GN after positioning to ER, DF, NP, GN, or END. GN calls RN as a subroutine.

| S: 008 m | R: 6, 7+ | F: None | SL: 4 | C: 36 |
| :--- | :--- | :--- | :--- | :--- |

## HA - HIGH RESOLUTION HISTOGRAM XROM 20,25 WITH AXIS

Prints a bar-chart bar whose height is proportional to the input in X , where X is between Ymin (stored in R00) and Ymax (stored in R01). Plot width (1 to 168 columns) is integer part; and column position of the axis ( 1 to 168) is fractional part of R02. Bar is printed from axis to value, either up or down. Character (ACCHR \#) to print portion of bar is stored in R05. Store values in R00 to R03 and R05, place the number in X, XEQ HA and a bar is added to the print buffer. Returns Fix 4 mode.

$$
\begin{array}{lllll}
\text { S: } 006 & \text { R: 0-5 } & \text { F: } 12,13 & \text { SL: } 5 & \text { C: } 29
\end{array}
$$

## HD - HIDE DATA REGISTERS

Input $\mathrm{k}, \mathrm{XEQ}$ HD to raise the curtain by k registers, and place in $R_{k}$ ( $R 00$ after the curtain is raised) an alpha constant used by UD to quickly lower the curtain. $\mathrm{Y}, \mathrm{Z}, \mathrm{T}$ preserved in $\mathrm{X}, \mathrm{Y}, \mathrm{Z} ; \Sigma$-reg is set to R00 (former $\mathrm{R}_{\mathrm{k}}$ ). Not interruptible if a printer is attached.

$$
\begin{array}{llll}
S: k+6 & R: 0, A & F:(R) & S L \\
\hline
\end{array} \quad C: 64
$$

Converts up to 14 hex characters in alpha to a non-normalized number (NNN) in X. Leading zeros need not be entered, and the space character can be used instead of zero. There are two acceptable characters for each hex digit greater than 9 : ' $A$ ' is equivalent to ':', 'B' to ';', 'C' to ' <', 'D' to '=', ' $E$ ' to ' $>$ ', ' $F$ ' to '?'. (The status of flag 10 is irrelevant.) $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ are preserved in $\mathrm{Y}, \mathrm{Z}, \mathrm{T}$.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: }(\mathrm{R}) & \text { SL: } 6 & \text { C: } 33
\end{array}
$$

## HP - HIGH RESOLUTION PLOT

XROM 20,29
Plots 1 to 9 user RAM functions simultaneously in high resolution in the $X$ direction ( 7 plot points per printed line). Store Ymin in R00, Ymax in R01, plot width (1 to 168 columns) in R02, Xmin in R08, Xmax in R09, X increment in R10. Function names (global labels 6 char's or less) are stored in R15 to R23. Place the number of functions in $X$ and XEQ HP. See HP writeup for flag usage and other options.

| S: 040 | R: 0-39, A | F: 4-10 | SL: 3 | C: 86 |
| :--- | :--- | :--- | :--- | :--- |

## HS - high resolution histogram XROM 20,26

Prints a bar-chart bar whose height is proportional to the input in $X$ where $0 \leq X \leq 1$. Plot width ( 1 to 168 columns) is stored in R04. Character (ACCHR \#) to print bar is stored in R03. Partial character (ACCOL \#) to print portion of the bar is stored in R05. Store values in R03 to R05, place the number in X, XEQ HS, and a bar is added to the print buffer.

$$
\text { S: } 009 \quad \text { R: 6-8 } \quad \text { F: None } \quad \text { SL: } 5 \quad \text { C: } 29
$$

Toggles flag (changes state: clear to set or vice versa) specified in X ( 0 through 55). $\mathrm{Y}, \mathrm{Z}$ preserved in $\mathrm{X}, \mathrm{Y}$.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: A/R } & \text { SL: } 6 & C: 60
\end{array}
$$

## IG - INTEGRATE

XROM 20,09
Store $f(x)$ global name in R10. Set flag 10 to view iterations. Set display mode to indicate desired accuracy of result. Key in limits
a ENTER b, XEQ IG. Integral approximation is returned in X .
Register usage:

| R10: function label name | R15: $S_{k}$ |
| :--- | :--- |
| R11: counter $k$ | R16: $(b-a) / 4$ |
| R12: $u_{i}$ | R17: $(b+a) / 2$ |
| R13: $1-u_{i}{ }^{2}$ | R18: $M(k, 0)$ |
| R14: $2^{1-k}$ | R19: $M(k, 1)$ |

The keyboard function B will XEQ IG after positioning to IG, SV, or FD. IG uses R10-R29.

| S: 030 m | R:10-29 + F: 9,10 SL: 4 C: 43 |
| :---: | :---: | :---: |

## IP - INITIALIZE PAGE

XROM 10,45
Stores information from status register c in absolute location 256 (decimal), the bottom register of the external portion of memory. This stored information will be used by PS to restore the proper pointers when the page is switched back on line. If you decide not to switch the page off line immediately after executing IP , execute PS (without actually switching pages - just R/S in response to the switching prompt) to clear location 256. $\mathrm{X}, \mathrm{Y}$ are preserved. $\Sigma$-reg is set to 000 absolute.

$$
\text { S: } 000 \text { R: } 256 \text { ABSOLUTE } \quad \text { F: (R) } \quad \text { SL: } 3 \quad C: 46
$$

## IR - INSERT RECORD

XROM 20,37
Store:
R07: 1st register of entire file
R08: number of registers per record
R09: number of records in the file
To make room to insert a new kth record, input $k$ and XEQ IR. R09 is updated. Inverse routine is DR.

| S: 010 m | R: 7-9 | F: None | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

## JC - JULIAN DAY NUMBER TO CALENDAR DATE

Clear flag 10 for Gregorian (modern) calendar. Set flag 10 for Julian calendar. Key JDN in X and XEQ JC. Date is returned in stack as:
Z: year $\quad Y$ : month $\quad \mathrm{X}$ : day of month Valid from March 1, 0 AD (1BC). Inverse routine is $\mathbf{C J}$. The
keyboard function e will XEQ JC after positioning to BD, TB, PM, CM, CJ, or JC.
S: 000 R: None $\quad$ F: 10 SL: 5 C: 53

## L — L LOAD PART OF LB

XROM 10,23
Prepare the program area (identified by LBL "++") as for LB. Then the program-writing program uses the instruction XROM [- to initialize the byte-loading process and return without prompting for bytes. (See -B for the loading of individual bytes.)

$$
\begin{array}{lllll}
\text { S: } 012 & \text { R: } 6-11, \text { A } & \text { F: } 8,9,25,50 & \text { SL: } 4 & C: 71
\end{array}
$$

## LB - LOAD BYTES

XROM 10,22
Permits the loading of arbitrary bytes into program memory, to facilitate synthetic coding. At location in program where bytes are to be loaded, key in LBL "++", +, +, +, . . ., XROM LB. The number of + 's should be at least $n+6$, where $n$ is the smallest multiple of 7 not less than the number of bytes you intend to load using LB. With the program pointer somewhere in this keyed-in sequence, switch to RUN mode and press R/S. The prompt "HEXIDEC INPUT" which precedes the prompt for byte \#1 reminds you that either hex or decimal input is acceptable, depending only upon whether the mode is ALPHA or not, at the time you key in an input. You can change the mode at will during the sequence. Press R/S after each entry. Pressing R/S without an entry tells the program you are through. You can back up a byte by using a negative entry or by XEQ 03 (even if you have told the program you are through, providing you have not begun to carry out the terminating instructions).
The prompt "SST, MORE +'S" indicates you do not have enough +'s to load even one byte. Pushing SST once will get you to LBL " ++ ", where in PRGM mode you can insert more +'s and restart. A reprompt can be obtained by XEQ 01.
The terminating procedure is prompted. The SST is in RUN mode. The DEL is in PRGM mode. Following your loaded bytes, there may be some final +'s (at most 6). The X-register contains a number of the form p .00 q . The termination prompt called for DEL 00p. Positioned at the first of any final +'s in PRGM mode, DEL 00q will remove these excess +'s and the XROM instruction.

$$
\begin{array}{lllll}
\text { S: } 012 & R: 6-11 \text { A } & \text { F: } 8,9,22,23,25,29 & \text { SL: } 0 & \text { C: } 71
\end{array}
$$

Add 16.016 to returned value to get bbb.eee where bbb and eee are the absolute decimal addresses of unused registers between the last used assignment register (if any) and the register containing.END. If flag 10 is set on completion of LF , the left half of the bbb register is occupied by a key assignment.

WARNING: Do not execute LF if I/O buffer exists (e.g., Timer Alarms). They will be disrupted and the free register block indices will be incorrect. Use the Save Alarms routine from PPC CJ V9N4P17.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 10 & \text { SL: } 4 & \text { C: } 59
\end{array}
$$

## LG - PPC LOGO

 XROM 20,24XEQ LG, ADV or PRBUF to print PPC Logo. SF 12 for double wide. 21 columns (can fit 10 char/line w/std logo; 18 char/line $\mathrm{w} / \mathrm{wide}$ logo; half of these with wide char). Stack is preserved.

$$
\text { S: } 000 \text { R: M,N,O, F: None } \quad \text { SL: } 5 \text { C: } 29
$$

## LR - LENGTHEN RETURN STACK

Stores $\leq 5$ return pointers (calls prior to that on LR ) in data registers $R_{x}$ and $R_{x+1}$ in a format permitting reinstatement by SR . Allows call depths as deep as available data storage space permits, provided that successive calls on LR are separated by no more than 5 levels of subroutine nesting. $\mathrm{Y}, \mathrm{Z}, \mathrm{T}$ are preserved in X, Y, Z (L contains old x plus 1).

| S: 002 m | R: A/R, A | F: None | SL: A/R | C: 40 |
| :--- | :--- | :--- | :--- | :--- |

## M1 - MATRIX, INTERCHANGE TWO ROWS

 XROM 20,33Store:
R07: start reg. of matrix
R08: \# columns in matrix
To interchange rows i and j , input i ENTER j XEQ $\mathbf{M 1}$.

$$
\text { S: 009m } \quad \text { R: } 7,8+\text { F: None } \quad \text { SL: } 4 \quad \text { C: } 61
$$

See M1. To multiply row $j$ by the constant $k$, input $k$ ENTER $j$ XEQ $\mathbf{m}_{2}$.

| S: 009 m | R: 7,8+ | F: None | SL: 4 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

M3 - MATRIX, ADD MULTIPLE OF XROM 20,32
ROW TO ANOTHER
See M1. To add $k$ times row $i$ to row $j$, input $j$ ENTER i ENTER k XEQ M3. Row j will change. Row i will not change.

| S: 009 m | R: 7,8, A | F: None | SL: 4 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

## M4 - MATRIX, REGISTER ADDRESS XROM 20,35 TO (i, j)

See M1. Input register $r$ and XEQ M4. Row number $i$ is returned in Y , column number j is returned in X . Inverse routine is M5.

| S: 009 m | R: $7,8,+0$ | F: None | SL: 4 | $C: 61$ |
| :--- | :--- | :--- | :--- | :--- |

## M5 - MATRIX, ( $\mathrm{i}, \mathrm{j}$ ) TO REGISTER XROM 20,36 ADDRESS

See M1. Inputi ENTER j and XEQ M5. Register number $r$ is returned in $X$. Inverse routine is $\mathbf{M 4} . Z, T$ are preserved in $Y, Z$.

| S: 009 m | R: 7,8+ | F: None | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

## MA - MEMORY TO ALPHA

XROM 20,54
Alpha recalls the contents of a block of data registers using an ISG control number in $X$ of the form bbb.eeeii. Inverse of $\boldsymbol{A M}$. $\mathrm{L}, \mathrm{Y}, \mathrm{Z}, \mathrm{T}$ are preserved.

| S: 005 m | R: A/R, A | F: None | SL: 5 | C: 16 |
| :--- | :--- | :--- | :--- | :--- |

[^0]XEQ MK first reports the number of registers available for assignments. (Should "NO ROOM" be reported, take corrective action before continuing, pressing R/S if your corrective action did not move the program pointer.) Then the program prompts "PRE†POST1KEY." Key in decimal equivalent of the first byte (prefix), ENTER, decimal equivalent of the second byte (postfix), ENTER, user keycode, R/S. After each successful assignment, the program will either prompt for another assignment or indicate no more available room with the message "DONE, NO MORE." (In the latter case, proceed as with the "NO ROOM" message.) If you do not wish to make any more assignments, there is no termination procedure; simply go on to whatever subsequent task you intended.
The messages "KEY TAKEN" followed by "KEYCODE?" is suggesting you select another keycode, since the one you specified is already in use. Your options are: (1) enter another keycode and press R/S; (2) enter zero, indicating your desire to restart the assignment in process, and press R/S; (3) delete the previous assignment to the key you want to use and press R/S.
The messages "NO SUCH KEY" followed by "KEYCODE" indicate that your keycode entry is illegal. Options (1) and (2) in the preceding paragraph apply to these error messages.
Error messages above and on/off will clear flag 20 and the MK program will recount key assignment registers to ensure no overlaps or gaps occur. Between key assignments, if PACK or SIZE are used, clear flag 20 before continuing assignments.

Not interruptible

$$
\begin{array}{lllll}
\text { S: } 012 & \text { R: 6-11, A } & \text { F: 7-10,20,25 } & \text { SL: } 3 & \text { C: } 61
\end{array}
$$

## ML - MEMORY LOST RESIZE TO 017

XROM 10,12
ILI should only be executed immediately after MASTER CLEAR, when the curtain and .END. are at their MEMORY LOST positions. XEQ MLD is essentially equivalent to XEQ SIZE 017, making more registers available for loading in long programs. Returns in FIX 2 mode. X, Y are preserved. Does not work on CX.

| S: N/A | $R: A$ | $F:(R)$ | SL: 0 |
| :--- | :--- | :--- | :--- |

## MP - MULTIPLE VARIABLE PLOT (1-9) XROM 20,28

Plots 1 to 9 user RAM functions or numerical values simul-
taneously in standard resolution (1 plot point per printed line). Store Ymin in R00, Ymax in R01, plot width (1 to 168 columns) in R02, Xmin in R08, Xmax in R09, X increment in R10. Function names (global labels 6 char's or less) are stored in R15 to R23. Place the number of function in X and XEQ MP. See MP writeup for flag usage and other options.

| S: 035 | R: 0-34,M,N,0 | F: 4-10 | SL: 3 | C: 86 |
| :--- | :--- | :--- | :--- | :--- |

## MS - MEMORY TO STACK

XROM 10,48
Recalls five data registers in sequence and stores them in X , $\mathrm{Y}, \mathrm{Z}, \mathrm{T}$, and L. R06 must contain the location of lowest register of the five register block. To use: N STO 06, XEQ MS. (If $\mathrm{N}=0$, then finish with RCL IND 06.) Inverse routine is sm.

| S: $N+5$ | R: A/R | F: None | SL: 5 | C: 46 |
| :--- | :--- | :--- | :--- | :--- |

## MT - MANTISSA OF X

Replaces X by its mantissa. Old X to L ; $\mathrm{Y}, \mathrm{Z}, \mathrm{T}$ preserved.

| S: 000 | R: A | F: None | SL: 6 |
| :--- | :--- | :--- | :--- |
| C: 60 |  |  |  |

## NC - NTH CHARACTER

Extracts the Nth character ( $1 \leq \mathrm{N} \leq 10$ ) from the right end of alpha register. This extracted character becomes the new contents of $X$ and the alpha register.
Old X to L; Y, Z preserved.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 25 & \text { SL: } 6 & \text { C: } 63
\end{array}
$$

## NH - NNN TO HEX

Decodes a non-normalized number (NNN) in X to 14 hex characters in alpha. $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ are preserved. The characters for hexadecimal digits greater than 9 depend on flag 10:

| Flag 10 (set): | $\dot{c}$ | $;$ | $<$ | $=$ | $>$ | $?$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| (clear): | A | B | C | D | E | F | (slower) |
|  | S: 000 | R: A | F: 10 | SL: 6 | C: 33 |  |  |

Input integer n in Y and starting trial divisor d in X . ( $\mathrm{d}=2$ or $d$ is an odd number greater than 2.) XEQ NP. $n$ is returned in $Y$ and next divisor $p$ is returned in $X$. Press R/S for the next factor. The keyboard function e will XEQ NP after positioning to $\mathbf{F R}, \mathbf{D F}, \mathbf{N P}, \mathbf{G N}$, or $\mathbf{R N}$.

| S: 000 | R: None | F: None | SL: 5 | C: 36 |
| :--- | :--- | :--- | :--- | :--- |

## NR - NNN RECALL

Recalls non-normalized number (NNN) stored by NS in $R_{x}$ and $\mathrm{R}_{\mathrm{x}+1}$. The NNN replaces the contents of X . $\mathrm{Y}, \mathrm{Z}, \mathrm{T}, \mathrm{L}$ are preserved.

| S: 002 m | R: A/R, A | F: None | SL: 6 | C: 16 |
| :--- | :--- | :--- | :--- | :--- |

## NS - NNN STORE

XROM 20,49
Stores Y and $\mathrm{R}_{\mathrm{x}}$ and $\mathrm{R}_{\mathrm{X}+1}$ in a format that allows recall by $\mathbf{N R}$ of the NNN. Y, Z, T preserved in X, Y, Z; (L contains old X plus 1).

| S: 002 m | R: A/R, A | F: None | SL: 6 |
| :--- | :--- | :--- | :--- |
| C: 16 |  |  |  |

## OM - OPEN MEMORY

XROM 10,58
Places curtain at absolute decimal address 16 (just above the status registers). om returns with the former contents of status register c in $\mathrm{X} . \mathrm{X}, \mathrm{Y}, \mathrm{Z}, \mathrm{L}$ preserved in $\mathrm{Y}, \mathrm{Z}, \mathrm{T}, \mathrm{L}$.

$$
\begin{array}{llll}
\text { S: } 000 & R: A & \text { F: (R) } & \text { SL: } 5 \\
\text { C: } & 60
\end{array}
$$

## PA - PROGRAM POINTER ADVANCE XROM 10,59

PA is a selectable byte jumper (not programmable). In PRGM mode position the program pointer to the line from which you want to byte jump. In RUN mode fetch the pointer with a RCL b. Then key $n$ and XEQ PA to yield a program pointer in $X$ moved by $n$ bytes: a plus integer $n$ moves the pointer downward in user memory, i.e., forward in the program. A STO $b$ will effect the actual byte jump. Switch to PRGM mode and see a line 00 display and press SST. (This SST from line 00 does not advance the program pointer. The HP-41 merely displays what it believes to be
line 01.) A GTO. (any line) or a BST will reestablish correct line numbers. X is preserved in Y .

| S: 000 | R:A | $F:(R)$ | SL: 0 | C: 60 |
| :--- | :--- | :--- | :--- | :--- |

## PD - PROGRAM POINTER TO DECIMAL XROM 10,52

Converts a program pointer in X (from the last 2 bytes of status register b in RAM format) to a decimal byte address. Inverse routine is DP. Y is preserved.

| S: 000 | R: A | F: None | SL: 5 |
| :--- | :--- | :--- | :--- |
| C: 60 |  |  |  |

## PK - PACK KEY ASSIGNMENT REGISTERS

XROM 10,09

To recover as many registers as possible, XEQ PK after several key assignment deletions. Interruptible, but execution must be completed. Returns number of assignment registers used in X. Flag 25 may end up set, so CF 25 after PK for safety. (See Warning on Page 17, under LFF .)

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 9,10,25 & \text { SL: } 4 & \text { C: } 59
\end{array}
$$

## PM - PERMutations

$P(n, k)=$ number of permutations of $n$ objects taken $k$ at a time. Input $n$ ENTER $k$ and XEQ PM. $P(n, k)$ is returned in $X . Z$ and T are preserved in $\mathrm{Y}, \mathrm{Z}$. The keyboard function C will XEQ PM after positioning to BD, TB, PM, CM, CJ, or $\mathbf{J C}$.

$$
\text { S: } 000 \text { R: None F: None SL: } 5 \text { C: } 53
$$

## PR - PACK REGISTER

XROM 20,45
Initialize: R10: base b R11: register pointer $=\mathrm{j}$. To store the number n in position k in register Rj , key n ENTER k XEQ PR . Inverse routine is UR . Note Rj should be cleared/initialized prior to its first use.

| Data Range | Base b | Position Numbers |
| :---: | :--- | :---: |
| $0-1$ | 2 | $1-30$ |
| $0-2$ | 3 | $1-19$ |
| $0-3$ | 4 | $1-15$ |
| $0-4$ | 5 | $1-13$ |
| $0-6$ | 10 | $1-11$ |
| $0-9$ | 14 | $1-10$ |
| $0-13$ | 21 | $1-8$ |
| $0-20$ |  | $1-7$ |

| Data Range | Base b | Position Numbers |  |
| :---: | :--- | :---: | :---: |
| $0-36$ | 37 | $1-6$ |  |
| $0-99$ | 100 | $1-5$ |  |
| $0-214$ | 215 | $1-4$ |  |
| $0-1413$ | 1414 | $1-3$ |  |
| $0-99999$ | 100000 |  | $1-2$ |

| C: 61 |  |  |  |

## PO - PAPER OUT

Advances the paper five times if the printer is enabled, else it may be used as a delay of about $1 / 5$ second.

$$
\text { S: } 000 \text { R: None F: None SL: } 5 \text { C: } 16
$$

## PS - PAGE SWITCH

Input:
Y : module number to turn off
X : module number to turn on
Alpha: destination program name
Execution of [PS from the keyboard or in a program implements a switch from page $Y$ to page $X$ by first storing information from status register c into absolute location 256 (decimal) of page Y , the bottom register of the switchable part of memory. Then if flags 10 and 24 are clear, a user prompt appears to switch page Y off and page X on.

Flag 10 is set, 24 is clear: two tones sound for switching page $Y$ off and $X$ on.

Flags 10 and 24 are set: a RTN is executed.
If PS continues, then location 256 of page $X$, which was previously initialized by IP or PS , is recalled and placed in status register c. Execution is then transferred to the destination program. X, Alpha are preserved in Y, Z. $\Sigma$-reg is set to address 256 absolute. Works on 41C only.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 10,24(R) & \text { SL: } 0 & \text { C: } 46
\end{array}
$$

## QR - QUOTIENT REMAINDER

Replaces Y and X by $(\mathrm{Y}-\mathrm{Y} \bmod \mathrm{X}) / \mathrm{X}$ (the quotient) and $\mathrm{Y} \bmod$ $X$ (the remainder). $\mathrm{Z}, \mathrm{T}$ are preserved; old X to L . Also, up to

14 characters in alpha will be preserved.

$$
\text { S: } 000 \text { R: } 0 \quad \text { F: None } \quad \text { SL: } 6 \quad \text { C: } 60
$$

## RD - RECALL DISPLAY MODE

XROM 20,05
Restores an earlier display mode stored by sD in $\mathrm{R}_{\mathrm{x}}$ (the register designated by the number in X ). Restores the earlier state of flags 16 through $55 . \mathrm{X}, \mathrm{Y}, \mathrm{Z}, \mathrm{T}$ preserved in L, X, Y, Z.

$$
\begin{array}{lllll}
\text { S: } 001 \mathrm{~m} & \text { R: A/R, A } & \text { F: A/R } & \text { SL: } 6 & \text { C: } 40
\end{array}
$$

## RF - RESET FLAGS

Stores hex 0000002 C 028000 in status register d; this resets flags to Master Clear status (except for FIX 2, rather than FIX 4). X, Y, Z, T, L are unchanged. Sets flags 26, 28, 29, 38, 40.

$$
\text { S: } 000 \text { R: A F: VAR SL: } 6 \text { C: } 64
$$

## RK - REACTIVATE KEY ASSIGNMENTS XROM 20,06

Transfers assignment bit maps stored in $\mathrm{R}_{\mathrm{x}}$ and $\mathrm{R}_{\mathrm{x}+1}$ (by $\mathbf{\text { SK }}$ ) into status registers $\vdash$ and $e$. This reactivates the suspended assignments. Y, Z, T preserved in X, Y, Z; (L contains old X plus 1).

$$
\text { S: 002m } \quad \text { R: A/R, A F: None } \quad \text { SL: } 6 \quad \text { C: } 40
$$

## RN - RANDOM NUMBER GENERATOR XROM 20,16

Store initial seed in $\mathrm{R}_{\mathrm{k}}$. To generate next random number r , $0<r<1$, key in $k$ and XEQ RND. The keyboard function "a" will XEQ INN after positioning to $\operatorname{FR}$, DFF, INP, GN, or ENN.

| S: 001m | R: A/R | $F:$ None | SL: 5 | C: 36 |
| :--- | :--- | :--- | :--- | :--- |

## RT - RETURN ADDRESS TO DECIMAL XROM 10,51

Converts a RAM return address (first return address, bytes 03 and 02 - third and fourth from the end of status register b) placed in X (by a RCL b for example) to a decimal byte address. See DP regarding legal byte addresses.

| S: 000 | R: A | F: None | SL: 5 | C: 60 |
| :--- | :--- | :--- | :--- | :--- |

## RX - RECALL FROM ABSOLUTE ADDRESS IN X

Only valid decimal addresses are 192 to 511 (64-511 with extended functions). Content of register accessed is normalized (so USE WITH CARE) and that is the form returned in X.
WARNING: If "NONEXISTENT" occurs restore the curtain (status register c) by ENTER, SST (in PRGM mode), R/S. Avoid using EXX with flag 25 set. Y, Z preserved; (L contains old $X$ minus 16).

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: (R) } & \text { SL: } 4 & \text { C: } 60
\end{array}
$$

## Rb - RECALL b

XROM 20,52
Yields an address in the PPC ROM permitting identification of the port it is plugged into. XEQ $\mathbf{R b}$, XEQ $\mathbf{N H}$; the last 4 nibbles will be $\times \mathrm{F} 12$, where $\mathrm{X}=9, \mathrm{~B}, \mathrm{D}, \mathrm{F}$ for ports 1 through 4, respectively. X, Y, Z, L are preserved in $\mathrm{Y}, \mathrm{Z}, \mathrm{T}, \mathrm{L}$.

| S: 000 | R: None | F: None | SL: 6 | C: 16 |
| :--- | :--- | :--- | :--- | :--- |

## S1 - STACK SORT

XROM 20,46
Arranges (sorts) the stack registers, $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$, and T in numerical order, lowest value in T, highest in X . Set flag 10 to place the lowest value in $X$, highest in $T$. $L$ is preserved, flag 10 cleared.

| S: 000 | R: None | $F: 10$ | SL: 5 | C: 47 |
| :--- | :--- | :--- | :--- | :--- |

## S2 - SMALL ARRAY SORT ( $\mathrm{N} \leq 32$ )

XROM 20,48
Sorts any block of registers in memory into numerical order (lowest value in lowest register) using a block control number in $X$ of the form bbb.eeeii. Optimum for arrays $\leq 32$, or for non-contiguous registers. X is saved. Not interruptible.

| S: 003 m | R: $1,2, A+$ F:10 | SL: 5 | C: 47 |
| :--- | :--- | :--- | :--- | :--- |

Sorts a block of registers in memory (from R03 up) into numerical order (lowest value in lowest register) using a block control
number in X of the form bbb.eee. For arrays $\leq 32$ or for noncontiguous registers use $\mathbf{S 2}$. $X$ is saved. Not interruptible.

$$
\text { S: 003m } \quad \text { R: 1,2,A+ F: } 10 \quad \text { SL: } 4 \quad \text { C: } 47
$$

## S? - SIZE FINDER ?

XROM 10,15
Returns number of data registers (above curtain) in X. X, Y, preserved in $\mathrm{Y}, \mathrm{Z}$.

| S: 000 | R: A | F: (R) | SL: $5 \quad$ C: 64 |
| :--- | :--- | :--- | :--- | :--- |

## SD - STORE DISPLAY MODE

Saves a display mode in $\mathrm{R}_{\mathrm{x}}$ (actually the status of flags 16 through 55). The earlier mode can be restored via ED. X, Y, $\mathrm{Z}, \mathrm{T}$ preserved in L, X, Y, Z.

$$
\text { S: 001m R: A/R, A F: None SL: } 6 \quad \mathrm{C}: 40
$$

## SE - SELECTION WITHOUT REPLACEMENT

Store:
R06: 1st register of selection block
R07: number of registers in block (consecutive)
SE calls routine [RN. Register k holds the random number seed. To make selection, key in $k$ and XEQ SE . The selected value is returned in X . R07 counts number of items remaining (as the block is rearranged).

| S: 008 m | R: $6,7+$ | F: None | SL: 4 | C: 26 |
| :--- | :--- | :--- | :--- | :--- |

## SK - SUSPEND KEY ASSIGNMENTS XROM 20,04

Stores assignment bit maps from status registers $\vdash$ and e into $\mathrm{R}_{\mathrm{x}}$ and $\mathrm{R}_{\mathrm{x}+1}$, respectively, and clears both of these status registers. Without these bit maps, the HP-41 assumes no user key assignments are in effect. Y, Z, T preserved in X, Y, Z; (L contains old X plus 1). Restore key assignments with $\mathbf{R K}^{\text {K }}$ or by reading in a program or status card.

| S: 002 m | R: A/R, A | F: None | SL: 5 | C: 40 |
| :--- | :--- | :--- | :--- | :--- |

Stores the stack registers $\mathrm{X}, \mathrm{Y}, \mathrm{Z}, \mathrm{T}$, and L into a continuous block of five registers, the lowest register number being stored in R06. To use, input n , STO 06, XEQ $\mathbf{s m}$. Inverse routine is $\mathbf{M S}$.

| S: 007 m | R: $6+$ | F: None | SL: 5 | C: 26 |
| :--- | :--- | :--- | :--- | :--- |

## SR - SHORTEN RETURN STACK

XROM 20,00
Recalls 5 return pointers stored in $\mathrm{R}_{\mathrm{x}}$ and $\mathrm{R}_{\mathrm{x}+1}$ (by LR ) combining them in status registers $a$ and $b$ with the return to the routine calling $\mathbf{\text { SR }}$. $\mathrm{Y}, \mathrm{Z}, \mathrm{T}$ are preserved in $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ (L contains old X plus 1).

$$
\begin{array}{lllll}
\text { S: } 002 \mathrm{~m} & \text { R: A/R, A } & \text { F: } 10 & \text { SL: A/R } & \text { C: } 60
\end{array}
$$

## SU - SUBSTITUTE CHARACTER

XROM 10,39
With a single character in Y and an integer in the range of 1 through 10 in $X$ (and with at most 13 characters in alpha), XEQ SU replaces the $x$-th character (counting from the right) of alpha by the character in Y . $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ preserved in $\mathrm{L}, \mathrm{X}, \mathrm{Y}$.

$$
\text { S: } 000 \quad \mathrm{R}(\mathrm{~A}) \quad \mathrm{F}: 25 \quad \text { SL: } 6 \quad \mathrm{C}: 63
$$

## SV - SOLVE FOR ROOTS

Store $\mathrm{f}(\mathrm{x})$ global label name in R06. Set display mode. Set flag 10 to view iterations. Input stepsize, ENTER, input guess, XEQ SV. (NOTE: if stepsize $=0$ then default is 1 percent of guess.) Register usage:

| R06: function label name | R08: $f\left(x_{i}\right)$ |
| :--- | :--- |
| R07: $x_{i}$ | R09: $d x_{i}$ |

The keyboard function C will XEQ SV after positioning to IG , sV, or FD.

$$
\begin{array}{lllll}
\text { S: } 010 & \text { R: 6-10 } & \text { F: } 10 & \text { SL: } 4 & \text { C: } 43
\end{array}
$$

## SX - store y in absolute ADDRESS $\mathbf{X}$

Only valid decimal addresses are 192 to 511 (64-511 with extended functions). Contents of Y is placed in register addressed by X .

WARNING: If 'NONEXISTENT' occurs, the code in Z must be stored in status register c to regain the former curtain position (by SST in PRGM, then R/S). $\mathrm{Y}, \mathrm{Z}$ are preserved in $\mathrm{X}, \mathrm{Y}$ ( $L$ contains old $x$ minus 16).

| S: 000 | R: A | F: $(R)$ | SL: 4 |
| :--- | :--- | :--- | :--- |
| C: 60 |  |  |  |

## Sb - STORE b

Provides a STO b with the ROM-mode interpretation. This permits ultra-fast ROM entry. See $\boldsymbol{A b}$. Stack is preserved.

| S: 000 | R: None | F: None | SL: A/R | C: 40 |
| :--- | :--- | :--- | :--- | :--- |

## T1 - BEEP ALTERNATIVE

Used in place of BEEP to produce a short sound burst ( 0.6 sec.) of 13 tones. Stack is preserved.

| S: 000 | R: None | $F:$ None | SL: 5 | C: 46 |
| :--- | :--- | :--- | :--- | :--- |

## TB - BASE TEN TO BASE B

XROM 20,18
Store base $b$ in $R 06$ ( $2 \leq=b \leq=19$ ). Input base 10 number and XEQ ITB. Base $b$ result is limited to 13 digits in alpha and will be displayed if flag 10 is set. (A missing single quote indicates overflow.) The stack is cleared. Inverse routine is BD. The keyboard function $B$ will XEQ TB after positioning to BD, TB, PM, CM, CJ, or JC.

$$
\begin{array}{lllll}
\text { S: } 007 & \text { R: } 6, \mathrm{~A} & \text { F: } 10,25 & \text { SL: } 4 & \text { C: } 53
\end{array}
$$

## TN - TONE N (0-127)

XROM 10,32
Effectively a TONE IND X instruction for synthetic tones. Place the TONE number in X, XEQ TNW . Valid inputs: 0-127 for TONE, 128-255 for TONE IND, 256-383 TONE, etc. Y, Z are saved in X, Y.

| S: 000 | R: A | $F: 14,25$ | SL: 4 | C: 60 |
| :--- | :--- | :--- | :--- | :--- |

## UD - UNCOVER DATA REGISTERS

XROM 10,08
Uses the contents of R00 (established by HD ) to lower the curtain to its previous position. If R00 has not been initialized,

MEMORY LOST results. Use of UD after editing or PACK will lose CAT 1. Stack including L is preserved. $\Sigma$ REG set to 01.

$$
\text { S: } 002 \text { R: 0, A } \quad \text { F: None } \quad \text { SL: } 6 \quad \text { C: } 59
$$

## UR - UNPACK REGISTER

XROM 20,44
Store:
R10: base $b \quad$ R11: register pointer $=j$
To recall the number stored in position k in register j . Input k in $X$ and XEQ UR. The unpacked number is returned in $X$. Inverse routine is $\mathbf{P R}$. Y is preserved in T .

| S: 012 m | R: 10,11 | F: None | SL: 5 | C: 61 |
| :--- | :--- | :--- | :--- | :--- |

## VA - VIEW ALPHA

XROM 10,07
Like AVIEW, but VA never causes the program to stop. If the printer is plugged in, turned on, and enabled by flag 21 being set, then the alpha register is also printed. The status of flag 21 remains unchanged and stack is preserved.

| S: 000 | R: (A) | F: 25 | SL: 6 | C: 59 |
| :--- | :--- | :--- | :--- | :--- |

## VF - VIEW FLAGS

XEQ $\mathbf{V F}$ displays the numbers of those flags which are set in groups of four (although the last group may contain less than four). X and Y are preserved.

$$
\text { S: } 000 \text { R: A } \quad \text { F: (R) } \quad \text { SL: } 4 \quad \text { C: } 26
$$

## VK - VIEW KEY ASSIGNMENTS

XROM 10,36
Defaults to printer function PRKEYS if printer is connected. Otherwise displays key codes assigned key by key from top to bottom, and from left to right (negative numbers correspond to shifted keys). If used in a program, first CLD or CF50. Stack is cleared.

| S: 000 | R:A | F: 21 | SL: 2 | C: 63 |
| :--- | :--- | :--- | :--- | :--- |

Views full mantissa of number in X. Leaves stack intact, but alters L and alpha register. Not interruptible.

| S: 000 | R:A | F: 21 | SL: 5 | C: 60 |
| :--- | :--- | :--- | :--- | :--- |

Insert the sequence n , XROM VS, FC?C 25, PROMPT in a program to verify that the SIZE is at least $n$. If it is not, the message "RESIZE > $=n$ " will be displayed following a quick tone. $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ and T are preserved in $\mathrm{L}, \mathrm{X}, \mathrm{Y}$, and Z . Alpha is not disturbed if SIZE is sufficient.

| S: 000 | R:A | F: 25 | SL: 6 | C: 60 |
| :--- | :--- | :--- | :--- | :--- |

## XD - HEX TO DECIMAL

XROM 10,25
Convert two hex digits - no more, no less - from the alpha register to the decimal equivalent ( 0 through 255). X is preserved in Y .

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: None } & \text { SL: } 4 & \text { C: } 71
\end{array}
$$

## XE - XROM ENTRY

XROM 10,19
XE Allows entry into ROM at any point using a pointer from the last two bytes of alpha register M, set up by the user prior to calling XE . A RTN activates this ROM entry address, and any subsequent END or RTN in the ROM program returns the pointer to the RAM program which called XE.
To set up the pointer in alpha register M, prior to program execution, position the pointer at the desired ROM line entry and manually perform the sequence (in RUN mode) CLA, RCL $b$, STO M, ASTO $n$, where $R_{n}$ is any data register you want to use. In the RAM program which is to enter the specified ROM line place the sequence ARCL $n, ~ X E Q ~ X E E$. Stack is preserved and alpha is cleared.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: A } & \text { F: } 14 & \text { SL: } 4 & \text { C: } 64
\end{array}
$$

Provides two [EB or $\mathbf{M K}$ bytes for user of synthetic instruc-
tions or synthetic key assignments. An XROM number of the form AA, BB is converted by AA ENTER BB XEQ XL. The Y register will contain the postfix bytes, and the $X$ register the prefix byte. $Z$ is preserved.

$$
\begin{array}{lllll}
\text { S: } 000 & \text { R: } 0 & \text { F: None } & \text { SL: } 4 & \text { C: } 26
\end{array}
$$

$\Sigma$ ? - $\Sigma$ REG FINDER ?
XROM 10,14
XEQ $\boldsymbol{x}$ ] yields the number of the first register of the statistical block of 6 registers. If the result is negative, the statistical block lies below the curtain (see $\mathbb{\Sigma C}$ ). X is preserved in Y .

$$
\begin{array}{lllll}
S: 000 & R: A & F:(R) & \text { SL: } 5 & C: 64
\end{array}
$$

## ミC - $\sum$ REG CURTAIN EXCHANGE

XROM 10,21
Interchanges pointers in status register c to the statistical register block and to R00. Provided SIZE $\geq k+6$, the sequence IREG $k$, XEQ EC makes the former $\mathrm{R}_{\mathrm{k}}$ now ROO, (but statistical register commands should not be used: E? yields $-k)$. A second XEQ ECC re-establishes the former position of the curtain (R00 again becomes $\mathrm{R}_{\mathrm{k}}$ ). $\mathrm{X}, \mathrm{Y}, \mathrm{Z}$ preserved, not interruptible if printer is attached.

$$
\begin{array}{lllll}
\hline \text { S: K+6 } & \text { R: None } & \text { F: }(\mathrm{R}) & \mathrm{SL}: 6 & \mathrm{C}: 64
\end{array}
$$
