This manual was produced with Ventura Publisher ${ }^{6}$ and a CANON BJ 10e ${ }^{\text {ab }}$ Bubble Jet Printer.

## Foreword

Thank you for the purchase of the SmartROM. You bought a quality software that will greatily help in your work, hobby or study!

If you are new to the 48 's world, we suggest you read carefully the User's manual before diving into deep waters of the SmartROM.

## The well-tempered 48

The SmartROM plays the 48 like no other product did before. Of course it is not perfect, but as you will experiment on your own, it will become difficult to do something without it. Its huge set of housekeeping hidden commands lets you solve problems that you hardly could imagine.

The SmartROM is designed to maximize programmer productivity by concentrating a lot of powerful commands and utilities in one package and setting a standard in some areas like symbolic matrix handling and meta objects manipulation. If you are an RPL enthusiast, you will appreciate SmartROM at most, reminiscing its venerable predecessors like the ZenROM and the PPCRom for the HP-41 and the JPCRom for the HP-71. For the joy of hackers we left a lot of commands in the dark. Sometimes we turn on the light at the right spot. Hidden commands have been created for future applications and represent a $40 \%$ of the whole ROM. We expect you dig deeply in the ROM to find them. If you get tired digging in the ROM, you may refer to the Hidden Commands Reference. As you will see later, some utilities on the disk use intensively SmartROM's hidden functions. This manual refers to version 1:B of the SmartROM wich fixes known bugs in the previous version, adds many new hidden functions and extends some commands as well. We hope also you will appreciate our efforts of keeping things as simple as possible, sacrificing sometimes speed to flexibility and expandibility. The concept of expandibility is a cornerstone of the SmartROM and represents, in our opinion, its first strong point. Second strong point is the Symbolic Matrix Writer which is the most complex application available for the SmartROM and one of the most useful tools available for the calculator.

All the information contained herein, when a different source is not specified, come from our own experiments on the calculator and are proprietary. Appendix C, containing Saturn Assembly Language description, complies with the description given in the HP-71 IDS Vol. I-II copyrighted by Hewlett-Packard.

For those who need an in-depth knowledge of the Smart ROM, a Hidden Commands Reference Manual (in English) is available.

## Manual's Contents

## Chapter 1: SmartROM Commands Reference

This is the reference section of the manual covering the entire set of commands listed in alphabetical order. For each command a stack diagram is given and remarkable information as well. Examples are collected at the end of each paragraph.

Appendix A: Warranty, Service and Support
Refer to this section when you encounter problems using the SmartROM.

Appendix B: Objects
HP-48 objects structure is explained in detail.
Appendix C: The Saturn Microprocessor
A description of the CPU and its machine language instruction set is given.

Appendix D: System calls

Most used system entry points are listed in address order.
Appendix E: Error Messages
Contains the complete list of the errors generated by the SmartROM along with possible causes.

Appendix H: Hidden Commands
Contains the exhaustive list of SmartROM hidden commands version $1: B$, subdivided in logic categories.

## List of Smart ROM RPL commands.

This is the complete list of SmartROM RPL commands subdivided in logic categories. Some commands appear in several categories being polymorphic functions.

## List of applications

This is the list of available applications stored on the diskette. INSTALL helps you installing the SmartROM by copying some auxiliary programs for the command PKMETA in the HOME directory and redefining the variable CST for a quick access to commands. Original value of CST is pushed on the stack. For this reason INSTALLshould be used only at installation time. Applications listed below are stored on the diskette along with their documentation.

Name<br>CALENDAR<br>FFT<br>LWC<br>UPC<br>MATMENU<br>PRSYMB<br>PROBJ<br>PRTHREAD<br>$L \rightarrow T H$<br>$\mathrm{TH} \rightarrow \mathrm{L}$<br>SHRINK<br>UPTRIM<br>PIE<br>BARPLOT2<br>INSTALL<br>INVRT<br>$\rightarrow$ FONT<br>alfaORDER<br>POPDIR<br>CGINDIR<br>REPLP<br>CGXLIB<br>XREF

## Typefaces conventions

DISPLAY
talics
.KEY]
LABEL

Used to represent text as it appear on the display or anything you must type.

Italics are used to introduce a new term or to emphasize words or sentences.

Keys are surrounded by square brackets.
This typeface represents a menu label.

## Typographic conventions

The special set of characters implemented in the 48 requires a special treatment in order to avoid misunderstanding. Greek characters are represented as their name in superscript mode. Below there is a table summarizing the conventions used throughout the manual.
\#b

Array (Vector).
Array (Matrix).
List.
Symbolic Matrix.

Any Meta-object.
String Meta-object.
External Library name.

## Automatic Installation

The installation of the library is, under normal circumstances, completely transparent to the user, who must only plug the card in the slot. HP-48 user's manual describes well this procedure in chapter 34 , Volume II.

Note that the configuration program of the library always attaches the libraries in the HOME directory. If you want to attach manually the library in a specified subdirectory, you must follow the procedure described in Chapter 34 of the HP-48 User's Manual. However if a warm start happens, the library will be reattached to the HOME directory.

After this stage, you can verify the installation of the SmartROM by following the procedure described below:

1) Type HOME [ENTER], then [Gold] LIBRARY: now, if you installed the card in Port 1 two new labels called MATW and SMART should appear in the menu. May be you need to press [NXT] to advance menu pages. The order in which labels appear depends on the number of libraries residing in memory. If you see these labels, go on to stage 5.
2) If the label does not appear, try to change port and start over again.
3) If labels do not appear yet, your card requires service. See in the Appendix A the details about Service and Warranty.

Type in the command line: \&:INSTALL [EVAL]
After some seconds, a copy of your CST variable should appear on the stack along with a custom menu.
6) The library is ready for use.

## Manual Installation

Type HOME ENTER, : ::INSTALL EVAL . If the calculator does not report errors and the value of CST appear on the stack, the library has been successfully installed, otherwise check the list below:

| ERROR | CAUSE \& REMEDY |
| :--- | :--- |
| Port Not Available | The card is not properly installed or is bad. <br> Try to reinstall the card or change slot. |
| none, but CST was |  |
| not pushed on stack. | May be you have an INSTALL program <br> overriding SmartROM's one. Cancel it. |
| Directory not You have a directory whose name is <br> allowed <br> conflicting with the subprogram being  <br> copin the HOME directory. Remove or  <br> rename the directory.  |  |

## SmartROM Commands Reference

This section explains in detail each command of the ROM, giving its stack representation, remarkable information, examples and names of applications containing the command. We strongly suggest you edit our applications and improve them with your own customization. If you have any question about SmartROM commands, contact us at the address given in Appendix A.

All SmartROM commands obey to the rules of HP-48 system commands, preserving stack contents. Symbolic matrix commands, do not preserve correctly LASTARG parameters because we used standard math operators during the calculations. When a calculation goes on, each operator saves its arguments for a subsequent LASTARG, effectively overriding previously saved parameters. Thus, if you try a LASTARG after a symbolic matrix command, resulting parameters reflect the stack arguments at the time of the last arithmetic operation. Nevertheless, after the execution from the keyboard of such a command the LAST STACK toggle (if enabled) works correctly and the original stack may be recovered.

All the commands are accessible via SmartROM's Custom menu once you invoke the command CSTMENU or you execute the Backup program INSTALL, as described in the previous chapter.

All the commands contained in this section belong to Library 821 (Smart) except MATWRT which belongs to Library 822 (MATLIB).

Library 821,822 and 823 have been allocated officially by Hewlett-Packard for Smart Technology's Products.

## They cannot be used by other commercial software developers.

If you remove the card from the HP-48SX, SmartROM commands will appear as XLIB 821 nnn, where nnn is a number between 0 and 251. Visible commands occupy the range 0-95. All other commands are hidden and have no correspondent text. If you want to know what hidden commands do, download the Hidden Commands Reference from the BBS and print it by yourself. Otherwise ask your dealer for a copy.

Hidden Commands contained in libraries other than 821 are not supported and shall not be used. Any future extension to SmartROM will use Library 822.

1: $\quad\left\{\left\{\right.\right.$ SymbA $_{1,1}+$ Symb $_{1,1}$ SymbA $_{1,2}+$ SymbB $_{1,2} \ldots$ SymbA $_{1, n}+$ Symb $\left._{1, n}\right\}$ $\left\{\right.$ SymbA $_{m, 1} \cdots$ SymbB $_{m, 1}$ SymbA $_{m, 2}+$ SymbB $_{m, 2} \ldots$ SymbA $_{m, n}+$ SymbB $_{m, n}$ I]

Performs the addition of two symbolic arrays.
A one-dimensional array must be written as one-row or one-column two-dimensional array. To avoid run-time errors the flag -3 must be clear, or, alternatively, each symbolic expression must evaluate to a numeric value.

The routine does not check for symbolic values. The reason is explained below:
the routine makes use of a hidden command which allows to pass the operator unevaluated. Moreover the operator is not restricted only to symbolic objects but can work on all pairs of objects for which the operation is meaningful. You could even make a list-array of real arrays and perform the addition cell by cell between each pair of arrays. See the example below.

ADDCON, DIMS, EQUAL?, MATWRT, MULT, MSYMB?, SUBT

MATMENU, PRSYMB

```
2: {{12 3}{ 'X' 'X+1' 'X-3'}
1: {{-1 2-3}{'-X-1' 'X+1' '3-X'}}
```

## ADD [ENTER]

1: $\quad\{1040\}\left\{-1\right.$ ' $\left.2+2^{*} X^{\prime} 0 \mid\right\}$
2: $\left\{\left[\begin{array}{lll}1 & 2 & 3\end{array}\right]\left[\begin{array}{ll}4 & 6\end{array}\right]\right\}$
1: $\{\{[-1-2-3][123]\}$
ADD [ENTER]
1: $\left\{\left[\begin{array}{llll}0 & 0 & 0\end{array}\right]\left[\begin{array}{lll}5 & 7 & 9\end{array}\right]\right\}$

| Category | Symbolic Matrix Manipulation |
| :---: | :---: |
| Affected by flag | -3 (Symbolic Result) |
| Input | $\text { 2: } \left.\quad \\| \text { Symb }_{1,1} \text { Symb }_{1,2} \ldots \text { Symb }_{1, n}\right\}$ |
|  | 1: Symb |
| Output |  |
| Function | Adds a constant value to all the elements of a list-matrix. |
| Notes | See notes about flag under ADD. |
| See Also | ADD, FACTOR, MATWRT, MSYMB? |
| Applications | MATMENU, PRSYMB |
| Examples | 2 : $\left\{\begin{array}{ccc} \{1 & 2 & 3\} \\ \left\{x^{\prime}\right. & x+1^{\prime} \times & \\ \left.3^{\prime}\right\} \end{array}\right.$ |
|  | 1: '-X-1' |
|  | ADDCON [ENTER] |
|  | 1 : |

| Category | Type Conversion |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Affected by flag | -5 to -10 (Binary Wordsize) and -11 to -12 (Binary Integer Base) |  |  |  |  |
| Input | 1: | h | Char | 1: | <h> |
| Output | 1: | \# |  |  |  |
| Function | Converts a numeric value into a binary integer. Extended precision numbers are not allowed. Pay attention to the current wordsize that may truncate the result. |  |  |  |  |
| Notes | $\rightarrow \mathrm{B}$ allows binary integers as input. This technique is useful to set the user free of inputting data in the preferred form. |  |  |  |  |

## CHL?

## Category

## Affected by flag

## Input

Output

## Function

Argument Checking
none
2: $\left.\quad\left\{\begin{array}{l}\text { obj }_{1} \\ \text { 1: } \\ \mathrm{t}_{1} \mathrm{t}_{2} \ldots \mathrm{t}_{2} \\ \mathrm{t}_{n}\end{array}\right\} \quad \mathrm{obj}_{p}\right\}$

2:
1: $\quad\left\{\right.$ obj $_{1}$ obj $_{2} \ldots$ obj $\left._{p}\right\}$
Checks if the elements of a list comply with the types specified. Each element of the list on the first level can be a real value (rounded to an integer) or a list of reals. Argument checking is strictly positionalin CHL?. If you need non-positional argument checking, use CHSET?.

Type Numbers follow the classification given by the command TYPE.

When a sublist of reals is specified, a multiple choice is allowed on that position of the input list.

The command return a boolean flag indicating success when the flag is 0 and a fault when the flag is 1 plus a list of mismatching positions.

The underlying meta-object structure of the result unifies the boolean convention with the meta-object convention. The output is especially suitable for IFT or IFTE input.

## Examples

## MATMENU

2: $\quad\left\{\begin{array}{lll}1 & 2 & " \prime \prime \\ 0 & 0 & 2\end{array}\right\}$

## CHL? [ENTER]

2: $\quad\left\{\begin{array}{l}\left.12^{\prime " \prime}\right\} \\ \text { 1: }\end{array}\right.$
2: $\quad\left\{\begin{array}{l}\left.12^{4 \prime \prime}\right\} \\ \text { 1: } \quad\{00\{01\}\}\end{array}\right.$

## CHL? [ENTER]

| 3: | $\left\{12^{" \prime \prime}\right.$ |
| :--- | :--- |
| 2: | $\{3\}$ |
| 1: | 1 |

## CHSET?

| Category | Argument Checking |
| :---: | :---: |
| Affected by flag | none |
| Input | $\begin{aligned} & \text { 2: } \\ & \text { 1: } \end{aligned} \quad\left\{\begin{array}{l} \text { obj }_{1} \text { obj }_{2} \ldots \text { obj } \end{array}\right.$ |
| Output |  |
| Function | Checks is objects contained in a list are of the type specified, independently from the position. Each element of the list of types must be a real number (rounded to an integer). Type Numbers follow the classification given by the command TYPE. The command return a boolean flag indicating success when the flag is 0 and a fault when the flag is 1 plus a list of mismatching positions. |
|  | The underlying meta-object structure of the result unifies the boolean convention with the meta-object convention. The output is especially suitable for IFT or IFTE input. |
|  | CHSET? is useful to check if a list contains homogeneus data with minimal memory requirements. |
| See Also | CHL?, CHST? |
| Examples |  |
|  | CHSET? [ENTER] |
|  | $\begin{aligned} & \text { 2: } \quad\left\{12^{\mu n}\right\} \\ & \text { 1: } \quad 0^{\prime} \end{aligned}$ |
|  | $\begin{array}{ll} \text { 2: } & \left\{12^{u n}\right\} \\ \text { 1: } & \{0\} \end{array}$ |
|  | CHSET? [ENTER] |
|  | $\begin{array}{ll} \text { 3: } & \left\{12^{u \eta}\right\} \\ \text { 2: } & \{3\} \\ \text { 1: } & 1 \end{array}$ |

| Category | Argument Checking |
| :---: | :---: |
| Affected by flag | none |
| Input | $\begin{array}{ll} N+1: & o b j_{1} \\ \ldots . & \cdots \ldots \\ 2: & \text { oj }_{n} \\ 1: & \left\{t_{1} t_{2} \ldots t_{n}\right\} \end{array}$ |
| Output |  |
| Function | Checks if the elements of the stack comply with the types specified in a list. Each element of the control list on the first level can be a real value (rounded to an integer) or a list of reals. Argument checking is strictly positional in CHST?. The first element of the control list specifies the type or the set of types allowed for the object lying on the correspondent level of the stack. In effect objects on the stack are mapped as if they were collected in a list, with the element on the top that comes last. |
|  | Type Numbers follow the classification given by the command TYPE. |
|  | When a sublist of reals is specified, a multiple choice is allowed on the corresponding level of the stack. The command return a boolean flag indicating success when the flag is 0 and a fault when the flag is 1 plus a list of mismatching positions. |
|  | The underlying meta-object structure of the result unifies the boolean convention with the meta-object convention. The output is especially suitable for IFT or IFTE input. |

1: $\quad 0^{\left\{\text {SymbB }_{p, 1} \cdots \text { SymbB }_{p, q} \text { \} }\right\}}$

Checks if the dimensions of two input matrices are suitable for row-by-column multiplication. If not a 0 is returned along with the input matrices.

We call this condition conformability. When you try a row-by-column multiplication between incompatible arrays a special error is issued to inform you of this particular condition.

No check is made on the input lists with regard to their contents. If you want to check in advance list contents, use MSYMB?.

Category Meta-object Manipulation

## Affected by flag none

Output

Function

Notes

Copies a section of the meta-object delimited by from and to above the level above, expanding the meta-object and updating the counter.

Top of stack contains the counter while level 2 contains the last object of the meta-object (as if it were the last element of a list). The fist element of the meta-object lies on level $\mathrm{n}+1$.

Input parameters (from) and (to) can be given in any order. If you specify for (above) a value greater than $n$, the section will be appended to the tail of the meta-object.

Note that you can copy a block within itself.
A bit of theory:
Meta-objects are a metaphysical entity invented by HP people to identify a set of objects getting handled as a whole thing. They are not worth to be considered a true object unless You have the SmartROM. As you will see later, there can be string meta-objects, real meta-objects and program meta-objects as well. The most esoteric form of a meta-object is the unbound meta-object wich has no counter at all, but only a marker above its head. Internal routines of SmartROM make heavily use of meta-object utilities, because of their intrinsic compactness.

## CSTMENU

| Category | Utility |
| :--- | :--- |
| Affected by flag | none |
| Input |  |

## Output

Function

Input
Redefines CST contents with the SmartROM custom menu (two pages) wich subdivides commands in six main areas called STACK, \$\&L, META, SYMB, TYPES, MISC for easier referencing and adds the following three new features:
\#CHR A keytrap for entering a character given its ASCII code. The trap waits indefinitely key presses and does not allow meaningless keystrokes. Character 0 cannot be entered nor characters above 255. If you disabled the beeper, no sound comes at key press nor the jingle that welcomes you to the keytrap. The message "Enter three digits" is displayed in the status area until you press the third key. The [ON] key is disabled. When you enter [2] [5], the keyboard is mapped to respond only to keys [0]-[5].

VISIT Enhanced Visit Function:

When you have a list-matrix on the first level of the stack you can edit it by pressing this keystroke, like you do with variables with the implicit STO. Once you enter in the Symbolic MatrixWriter environment, you will see old labels and new ones as well. Known labels like $\rightarrow$ GO, $\rightarrow$ STK and WID $\rightarrow$ still act in the usual way. EQ W is a new feature that allows you to pass a cell to the EquationWriter for editing. The cell cannot be empty. If you press [ON] while you are in the EquationWriter, the old value is restored in the cell and you will be returned to the MatrixWriterenvironment. By pressing [ENTER], you validate any modification. +ROW, -ROW, +COL, - COL act in the usual way. $\rightarrow$ ROW, $\leftarrow$ ROW, $\rightarrow$ ROW, $\downarrow$ ROW, $\rightarrow$ COL, - COL, $\uparrow$ COL, $\downarrow$ COL rotate blocks of rows or columns. If you change menu while in the MatrixWriter, you can restore the main menu by pressing [Blue] [ENTER]. Within this environment you cannot enter values other than Symbolics, that is Reals, Complex, Units, Algebraics, Global names. If you try to enter objects other than these, an error will be issued.

## DELCOL

| Category | Symbolic Matrix Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | $\text { 2: } \quad \begin{array}{ll}  & \left.\\| \text { Symb }_{1,1} \text { Symb }_{1,2} \ldots \text { Symb }_{1, n}\right\} \\ & \\ & \left\{\text { Symb }_{m, 1} \text { Symb }_{m, 2} \ldots \text { Symb }_{m, n} \\|\right. \end{array}$ |
|  | $1: \quad \mathrm{j}$ |
| Output |  |
| Function | Deletes the specified column from the list. |
| Notes | No restrictions on the shape of the list. If an invalid subscript is specified, an error is issued. The list-matrix can contain any object type. If you need to delete at once column and row, use CMPL. |
| See Also | CMPL, CONSTMAT, DELROW |
| Examples |  |
|  | DELCOL [ENTER] |
|  | $\text { 1: } \quad\left\{\begin{array}{cc} \left\{\begin{array}{cc} 0 & 0 \\ 1-X^{\prime} & 2-X^{\prime} \end{array}\right\} \\ 0 & -4\} \end{array}\right\}$ |

## DELETE

| Category | Meta-object Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | $\ldots{ }^{\text {...: }} \quad \mathrm{obj}_{1}$ |
|  | $\ldots$... |
|  | $\ldots: \quad \mathrm{obj}_{\text {from }}$ |
|  | $\ldots$...: $\quad$ obj |
|  |  |
|  | 4: $\quad \mathrm{obj}_{n}$ |
|  | 3: $\quad n^{\text {n }}$ |
|  | 2: from |
|  | 1: to |
| Output | $\ldots: \quad$ obj $_{1}$ |
|  | ...: |
|  | ...: obj ${ }_{\text {from }-1}$ |
|  | $\cdots: \quad 0 j_{10+1}$ |
|  |  |
|  | 1: $\quad \mathrm{n}$ - ABS (from-to +1 ) |
| Function | Deletes a block of the meta-object, updating the counter. |
| Notes | (from) and (to) can be given in any order. Values out of range will generate an error message. When you delete all the objects, on the stack remains only a 0 (the counter). |

$\ddot{\text { Symb }}_{\mathrm{m}, 1}$ Symb $_{\mathrm{m}, 2} \quad \ldots$ Symb $_{\mathrm{m}, \mathrm{n}} \|$
Deletes the specified row from the list.
No restrictions on the shape of the list. If an invalid subscript is specified, an error is issued. The list-matrix can contain any object type. If you need to delete at the same time a pair of crossing column and row, use CMPL.

## CMPL, CONSTMAT, DELCOL

## DELROW [ENTER]

| Category | Symbolic Matrix Manipulation |
| :---: | :---: |
| Affected by flag | -3 (Symbolic Result) |
| Input | 1: $\quad \begin{array}{lll}\quad\left\{\text { Symb }_{1,1} \text { Symb }_{1,2}\right. & \left.\cdots \text { Symb }_{1, n}\right\} \\ & \left\{\text { Symb }_{n, 1} \text { Symb }_{n, 2} \ldots \text { Symb }_{n, n} \\|\right.\end{array}$ |
| Output | 1: Symbolic |
| Function | Calculates the determinant of a square symbolic matrix. |
| Notes | The result has not been simplified yet. You can use EXPAND and COLCT or the sample program EXCO described in Chapter 31 of the HP-48 User's Manual. The algorithm being used is described in the Hidden Commands Reference. |
|  | The algorithm is optimized and makes large use of pivoting. The precision of a numeric result varies from case to case. Sometimes is more precise than DET, while in other case is worse. |
| See Also | SQUARE? |
| Applications | INVRT, MATMENU, PRSYMB |
| Examples |  |
|  | DETERM [ENTER] EXCO [ENTER] |
|  | ```'-2-1/\mp@subsup{X}{}{*}\mp@subsup{Y}{}{\wedge}2-8/\mp@subsup{X}{}{*}\mp@subsup{Y}{}{\wedge}3-2/\mp@subsup{X}{}{*}Y+\mp@subsup{X}{}{*}\mp@subsup{Y}{}{\wedge}2+4**\mp@subsup{X}{}{\wedge}2-\mp@subsup{X}{}{\wedge}3+12* -2*Y^2+X-Y'``` |

## DIMS

| Category | Symbolic Matrix Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | $\begin{array}{ll} \text { 1: } \quad & \left.\\| \text { Symb }_{1,1} \text { Symb }_{1,2} \ldots \text { Symb }_{1, n}\right\} \\ & \\ & \text { SYymb }_{m, 1} \ldots \text { Symb }_{m, 2} \ldots \text { Symb }_{m, n} \\| \end{array}$ |
| Output | $\begin{array}{ll} \text { 2: } & \left\{\text { SYyb }_{1,1} \text { Symb }_{1,2} \ldots \text { Symb }_{1, n}\right\} \\ & \\ \text { 1: } & \left\{\text { SYymb }_{m, 1} \ldots \text { Symb }_{\mathrm{m}, 2} \ldots \text { Symb }_{\mathrm{m}, \mathrm{n}} \\|\right. \end{array}$ |
| Function | Returns the dimensions of the list-matrix, checking matrix consistency. If a dimensional error is detected, an error messagge is issued. |
| Notes | No check is made on object types. If you want to check it, use MSYMB?. |
| See Also | CONFORM?, MATWRT, MSYMB?, SQUARE? |
| Applications | INVRT, MATMENU, PRSYMB |

## $E X T \rightarrow$

| Category | Type Conversion |
| :---: | :---: |
| Affected by flag | none |
| Input | 1: obj |
| Output | 1: addr |
| Function | Returns the memory address where the object is stored. When the address is less than ph the object is stored in ROM. |
| Notes | EXT $\rightarrow$ is particularly useful to decipher External Objects. Extemal is the raw representation of a system address. Making it a system binary, makes the thing a new ball game. Externals are explained in Appendix C. A list of Externals is given in Appendix D. |
| See Also | $\rightarrow$ EXT, SYS $\rightarrow$, $\rightarrow$ SYS. |
| Examples | 1 EXT $\rightarrow$ [ENTER] |
|  | 1: <2A2C9h> |
|  | \#2A2C9 SYSEVAL [ENTER] |
|  | 1: 1 |
|  | TRUE [ENTER] |
|  | 1: External |
|  | EXT $\rightarrow$ [ENTER] |
|  | 1: <03A81h> |

| Category | Type Conversion |
| :---: | :---: |
| Affected by flag | -5 to -10 (Binary Wordsize) and -11 to -12 (Binary Integer Base) only when the input number is a binary integer. |
| Input | 1: addr |
|  | or |
|  | 1: \#addr |
| Output | 1: Obj |
| Function | Pushes on the stack a ROM address. |
| Notes | If at the address specified begins a machine language routine, the stack display will show External on the first level. Unfortunately the HP-48 represents with 'External' meaningless address too, thus pay attention before using an External. When you supply an address at which an RPL object is stored, the Stack display will show you the correspondent text representation. A sequence of threads will be displayed as a stream of Externals. |
|  | Meaningful Externals are collected in the Appendix D. |
| See Also | EXT $\rightarrow$, $\rightarrow$ PRG. |
| Applications | $L \rightarrow$ TH, SHRINK, TH $\rightarrow$ L. |
| Examples | 1: \#30794h |
|  | $\rightarrow$ EXT [ENTER] |
|  | 1: External |
|  | [EVAL] |
|  | 1: "HPHP48-x" $\quad x=$ revision letter (A,B,C,D or $E$ ) |
|  | 1: \#2B0F2h |
|  | $\rightarrow$ EXT [ENTER] |
|  | 1: Long Real |

## FACTOR

| Category | Symbolic Matrix Manipulation |
| :---: | :---: |
| Affected by flag | -3 (Symbolic Result) |
| Input | $\begin{array}{ll} \text { 2: } & \left.\\| \text { Symb }_{1,1} \text { Symb }_{1,2} \ldots \text { Symb }_{1, n}\right\} \\ & \quad \text { Syymb }_{m, 1} \ldots \text { Symb }_{\mathrm{m}, 2} \ldots \text { Symb }_{\mathrm{m}, \mathrm{n}} \\| \end{array}$ |
| Output | 1: $\quad$ \{Symb* Symb $_{1,1}$ Symb $^{*}$ Symb $_{1,2} \ldots$ Symb $^{*}$ Symb $\left._{1, n}\right\}$ <br> \|Symb*Symb ${ }_{m, 1}$ Symb* $^{*}$ Symb $_{m, 2} \ldots$ Symb*Symb $_{m, n}$ \|| |
| Input |  |
| Output |  |
| Function | Multiplies all the elements of the list-matrix by the Symbolic value Symb or performs in-place multiplication between pairs of elements. |
| Notes | A one-dimensional array must be written as one-row or one-column two-dimensional array. In order to avoid rum-time errors the flag -3 must be clear, otherwise it will be necessary a numeric value for each symbol to carry out the calculation numerically. |
|  | The routine does not check for symbolic values. The reason is explained below: |
|  | The routine makes use of a hidden command which allows you to pass the operator unevaluated. Moreover the operator is not restricted only to symbolic object but can work on all pairs of elements for which that operation is meaningful. |
| See Also | ADD, DETERM, MULT, SQUARE?, SUBT |
| Applications | MATMENU |

| Category <br> Affected by flag <br> Input | Type Conversion <br> none |
| :--- | :--- |
| Output | 1: External (FALSE) |
| Function | Pushes on the stack the system boolean FALSE. |
| Notes | System booleans are machine language routine addresses <br> which merely return themselves when evaluated. The <br> command $\rightarrow$ TorF turns a system boolean into a real <br> boolean. |
| See Also | EXT $\rightarrow$,TRUE, $\rightarrow$ TorF |

## FIND

## IDNT

| Category | Symbolic Matrix Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | 1: $n$ |
| Output | 1: $\left.\quad \left\lvert\, \begin{array}{cccc}11 & 0 & \ldots & 0 \\ 10 & 1 . . & 0\end{array}\right.\right\}$ |
|  | $10 \quad 0 \ldots 11]$ |
| Function | Returns the identity list-matrix of order n . |
| See Also | CONSTMAT |
| Applications | MATMENU |
| Examples | 1: 3 |
|  | IDNT [ENTER] |

Category Input/Output
Affected by flag
none
Input

## Output

Function

Notes
2: <KEYh>
1: <SHIFTh> like any other key.

Waits indefinitely for a keypress. The [ON] key is trapped

The Keyboard is numbered, starting from the upper left corner down to the lower right corner in row major order. The key associated to A is numbered $<1 \mathrm{~h}>$ and the last is <2Fh> (49d). KEYWAIT detects shifted keys so that [ALPHA], [Gold] and [Blue] cannot be trapped singularly. The shift status is so encoded:

| $<1 \mathrm{~h}>$ | no SHIFT | This encoding system requires |
| :--- | :--- | :--- |
| $<2 \mathrm{~h}>$ | [Gold] | fewer processing than that required |
| $<3 \mathrm{~h}>$ | [Blue] | to dispatch a key trapped with 0 |
| $<4 \mathrm{~h}>$ | [alfa] | WAIT. Moreover the [ON] key is |
| $<5 \mathrm{~h}>$ | [alfa] [Gold] | trapped like any other key. |
| $<6 \mathrm{~h}>$ | [alfa] [Blue] |  |

The KEYWAIT internal routine is the most simple application of what HP calls Parameterized Outer Loop, also known as ParOuterLoop. This routine is the core of any interactive built-in application thanks to its flexibility. The GRAPHics editor uses the same basic routine as KEYWAIT ! ParOuterLoop is well explained in the documentation provided by HP as HP-48 RPL compiler Doc, you can easily get as EduCALC Goodies disc \#4.

Graphics
none
2: $\quad \operatorname{Grob}_{m \times h}$
1: $\quad$ Grob $_{p \times h}$
1: $\quad \operatorname{Grob}_{(p+m) \times h}$
Appends the grob on the first level to the right side of the grob on the second level.

Grobs must have the same height. The result is placed in a new grob.

JOINUP, RPT
$\rightarrow$ FONT, PROBJ

## JOINUP

| Category | Graphics |
| :--- | :--- |
| Affected by flag | none |
| Input | $2: \quad G^{\text {Grob }}{ }_{w \times h}$ |
| Output | $1: \quad G r o b_{w \times(h+1)}$ |
| Function | Appends the grob on the first level to the top side of the <br> grob on the second level. |
| Notes | Grobs must have the same width. The result is placed in a <br> new grob. |
| See Also | JOINR |

## L2M

## LINES $\rightarrow$

Category String and Meta-object Manipulation

| Affected by flag | none |
| :---: | :---: |
| Input | 1: str |
| Output |  |
| Function | Splits the string into several lines breaking at linefeeds. |
| Notes | Linefeeds are used by the 48 as newline characters in the editor. Moreover they are translated to the sequence CR LF during the transmission to a printer when the translation parameter in the global variable IOPAR has a value greater than 0 . LINES $\rightarrow$ removes the linefeeds, but blows up on the stack the string in several chunks. However the routine ignores linefeeds falling between double quotes. |

See Also $\rightarrow$ LINES.

| Category | String and Meta-object Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | $\mathrm{N}:$ str $_{1}$ obj $_{1}$ <br> $\ldots:$ $\ldots$ obj $_{n}$ <br> $\ldots:$ str $_{n}$ $n$ <br> $1:$ n  |
| Output | 1: str |
| Function | Joins objects by means of a linefeed. |
| Notes | It is the inverse of LINES $\rightarrow$. |
| See Also | LINES $\rightarrow$, SPLIT |
| Applications | PROBJ |

## LOC

| Category | String Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | $\begin{array}{ll} \text { 3: } & \operatorname{str}_{1} \\ \text { 2: } & \operatorname{str}_{2} \\ \text { 1: } & \text { pos } \end{array}$ |
| Output | 1: pos |
| Function | Seeks $\mathrm{Str}_{2}$ in $\mathrm{Str}_{1}$ starting from position pos. If no match is found it returns 0 , otherwise the absolute location of the match. |
| Notes | LOC is an extension of POS. |
| See Also | MEMBER, SPAN |
| Examples | $\begin{array}{ll} \text { 3: } & \text { "abcdabcdabcd" } \\ 2: & \text { "abc" } \\ 1: & 2 \end{array}$ |

| 1: | $\left\{\mathrm{obj}_{1} \mathrm{obj}_{2} \ldots \mathrm{obj}_{\min (\mathrm{n}, \mathrm{p})}\right\}$ |

Applies each operator to the pairs of elements taken from the operand-list in levels 2 and 3.

When the operand-lists have different size, exceeding objects are ignored. If you need to perform a calculation based on the current value of the counter, use the identifier 'idx' as counter. It will be replaced by the actual value.

| Applications | CALENDAR |

## MEMBER

| Category | String Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | $\begin{array}{ll} \text { 3: } & \operatorname{str}_{1} \\ \text { 2: } & \operatorname{str}_{2} \\ \text { 1: } & \text { poos } \end{array}$ |
| Output | 1: pos |
| Function | Returns the absolute position of the first character in $\mathrm{Str}_{1}$ comprised in $\mathrm{Str}_{2}$, starting from position pos. If no match is found, returns 0 . |
| Notes | MEMBER is useful to skip text given a particular set of characters, typically punctuation characters or delimiters. |
|  | Frequently used string-constants has been stored in ROM to save memory: |
|  | $\begin{aligned} & \text { DIGIT\$ }=" 0123456789 " \\ & \text { alfaLOW }=\text { "ABCDEFGH...XYZ" } \\ & \text { alfaUPP\$ }=\text { "abcdefgh...xyz" } \end{aligned}$ |
|  | They are accessible in the fifth page of menu \$\&L in CST. |
|  | Try also $821250 \rightarrow$ Xlib [ENTER] [EVAL] and 821 $251 \rightarrow$ Xlib [ENTER] [EVAL] |
|  | MEMBER and SPAN are useful to check input from the user, for the presence or absence of certain characters. Typically they are used to implement parser routines in conjunction with SPLIT, SUB and other String manipulation functions. Appendix H lists hidden string functions. |
| See Also | SPAN, SPLIT |
| Examples | $\begin{array}{ll} \text { 3: "123456789A12DEF" } \\ \text { 2: } & \text { "ABCDE" } \\ \text { 1: } & 11 \end{array}$ |

## MSYMB?

| Category | Symbolic Matrix Manipulation |
| :---: | :---: |
| Affected by flag | -3 (Symbolic Result) |
| Input |  |
| Output |  |
| Function | Performs row by columns multiplication between symbolic arrays. |
| Notes | List-matrices must have compatible dimensions, that is if the first array is a $(\mathrm{m}, \mathrm{n})$ the second must be ( $\mathrm{n}, \mathrm{p}$ ). We called this special property conformability (see under CONFORM?). When the aforementioned condition is violated, an error is issued. If the flag -3 is set, run-time erros may happen if an identifier cannot be resolved to a numeric value. In-place multiplication is performed by FACTOR. The last example below shows you the difference between row by column and in-place multiplication. |
| See Also | CONFORM?, FACTOR |
| Applications | MATMENU, PRSYMB |
| Examples | $\begin{array}{ll} 2: & \left\{\{12\}^{\prime} x^{\prime} \times x-1 '\right\} \\ 1: & \left.\left\{\mid-x^{\prime}-1\right\}\right\} \end{array}$ |
|  | MULT [ENTER] |

## Category

## Affected by flag

## Input

Output

## Function

Type Conversion
none
1: obj
1: obj (null)
Replaces the input object with the null object of the same type respect to the addition operation.

Only the objects listed below have a correspondent null object.

Type Null element

$$
\begin{aligned}
& 0 \\
& (0,0) \\
& {[0, \ldots 0] \text { or }[[0, \ldots 0] \ldots[0 \ldots 0]]} \\
& [0,0) \ldots(0,0)] \text { or }[[(0,0) \ldots(0,0)] \ldots[(0,0) \ldots(0,0)]] \\
& 0 \\
& 0 \\
& 0 \\
& 0 \\
& \text { \#Oh } \\
& \text { Blank } w \times \text {. } \\
& \text { inherits from the ancestor if defined. } \\
& 0 \text { unit } \\
& <\text { Ohh }
\end{aligned}
$$

## Notes A Tagged object inherits ancestor's type.

Polymorphism is a property of RPL language (at user level). It allows you to design object-independent algorithms. Of course some operations make sense only with certain entities, but setting the algorithm free from object slavery, you will save time later, when you need to recycle the routine.

The NULL command lets you design recursive algorithms or loop structures independently from the input object type. Typically such algorithms need some initialization code in order to start a chain calculation. The + (plus) Command is the most flexible operator built in the 48. The NULL command lets you initialize every routine based on concatenation or addition without knowing in advance the object type.

## PARSE

## Category String Manipulation

Affected by flag

Input
Output

Function
-5 through -10 (wordsize), -15 and -16 (coordinate system), -17 and -18 (angle mode)

1: $\quad$ str

|  |  |  | 4: | str |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  | 3: | <last> |
| 2: | prg |  | 2: | "characters" |
| 1: | External (TRUE) | 1: | External (FALSE) |  |

Performs the parsing of the input string. If no syntax error is detected an object containing the executable code is returned along with the system boolean TRUE. Otherwise the original string, the absolute position of the last character scanned and the text containing the syntax error are returned along with the system boolean FALSE.

Notes
By extending the system parser, it is possible to handle unsupported object types like system binaries. The example given below shows a possible technique, you could enhance at your will.
on-the-fly parser handling system binaries:

| « $0 \rightarrow$ current | initializes replacement counter |

EVAL [GRAPH]

| Category | Meta-object Manipulation |
| :---: | :---: |
| Affected by flag | -56 Beep |
| Input | $\mathrm{N}+5:$ obj $_{1}$ <br> $\ldots:$ $\ldots$ <br> 6: obj $_{n}$ <br> $5:$ $n$ <br> $4:$ begin <br> $3:$ current <br> $2:$ lines <br> $1:$ row |
| Output | [ENTER] [ON] |
|  | $N+5:$ obj $_{1}$   <br> $\ldots:$ $\ldots$ $N+4:$ obj $_{1}$ <br> $6:$ obj  $\ldots:$ <br> 5: $n$ $\ldots:$ $\ldots$ <br> 4: begin $4:$ $n$ <br> $3:$ current $3:$ begin <br> $2:$ objcurrent+begin $2:$ current <br> $1:$ 1 $1:$ 0 |
| Function | Shows a catalog of a specified number of lines beginning on a specified display line. The selection of the object is interactive and mantains the functionalities of the built-in catalog. |
| Notes | Command parameters are so defined : |
|  | $\mathrm{obj}_{1}$ |
|  | $\cdots \mathrm{obj}_{n}$ |
|  |  |
|  | input meta-object. |
|  | begin |
|  | index of the first object on which beginning the page minus one (from 0 to $n$-lines). |
|  | current |
|  | current element within the page (from 1 to lines). |
|  | lines |
|  | height of the page in lines (from 1 to 8 -row). row starting row of the display (from 1 to 7 ). When using a value less than 2, FREEZE may be required. |
|  | Values exceeding the limits are rejected with an error. |
|  | Selecting an object means moving the pointer to the line containing the object and press [ENTER]. Once you press [ENTER] the catalog is exited and the selected object is duplicated as shown in the stack diagram. The selection may be aborted by pressing [ON]. In this case only the last pointer position is returned. Arrow keys perform |

pointer movements in the same way the built-in catalog allows.

PKMETA is very flexible because each action associated to a key may be redefined. Each defined key must be associated to a program stored in user memory. The following table summarizes the PKMETA auxiliary programs and data structures and the default keys along with their actions:

| Global Name | Keycode | Action |
| :---: | :---: | :---: |
| KEYS | n/a | Mantains the list of defined keys. Each element of the list is a list containing two system binaries. The first number represents the absolute key number h to Dh , the second represents the shift plane $h$ to $h$. This encoding system matchs KEYWAIT format. |
| ACTIONS | n/a | Mantains the list of the actions associated to the keys. The list must always have at least one element. The first element is a name of the program that must be called when an undefined key is pressed. By default this name is BADKEY. The second element corresponds to the first keycode stored in KEYS and so on. ACTIONS must always contain a number of actions equal to SIZE(KEYS)+1. Otherwise a special error code will be issued. |
| BADKEY | n/a | The action taken when an undefined key has been pressed. |
| ATTN | $\begin{aligned} & \text { <2Dh> } \\ & \text { <1h> } \end{aligned}$ | The action associated to the pressing of [ON]. By default it aborts the selection. |
| DOWNARR | $\begin{aligned} & <11 \mathrm{~h}\rangle \\ & <1 \mathrm{~h}> \end{aligned}$ | The action associated to the pressing of [ l ]. It moves the pointer downwards, eventually scrolling up the page by one line. |
| UPARR | $\begin{aligned} & <0 \mathrm{Bh}> \\ & <1 \mathrm{~h}> \end{aligned}$ | The action associated to the pressing of [ $\dagger$ ]. It moves the pointer upwards, eventually scrolling down the page by one line. |
| ENTER | $\begin{aligned} & <19 h> \\ & <1 h> \end{aligned}$ | The action associated to the pressing of [ENTER]. By default it confirms the selection and exits the catalog. |
| PGUP | $\begin{aligned} & <\mathrm{OBh}> \\ & <2 h> \end{aligned}$ | The action associated to the pressing of [Gold][ $\dagger$ ] . It displays the previous page. |
| PGDOWN | $\begin{aligned} & <11 h> \\ & <2 h> \end{aligned}$ | The action associated to the pressing of [Gold] [ 4 ]. it displays the next page. |
| TOP | $\begin{aligned} & <0 \mathrm{Bh}> \\ & <3 \mathrm{~h}> \end{aligned}$ | The action associated to the pressing of [Blue] [ T ]. Moves the pointer to the top of catalog. |
| BOTTOM | $\begin{aligned} & <11 h \gg \\ & <3 h \gg \end{aligned}$ | The action associated to the pressing of [Blue] [ 1 ]. Moves the pointer to the bottom of the catalog. |
| ENHANCE | n/a | The routine that displays the current line and the pointer. |

All the programs described above can be modified at your will. There are 5 parameters stored in temporary variables which contain the information you need to take some action. They represent the current value of the input parameters passed on the stack. Please note that this values are stored as system binaries and not as real numbers.

| n | counter | Keeps stored the total number <br> of elements of the meta-object <br> (the counter) |
| :--- | :--- | :--- |
| 0 | begin <br> page | This is the offset to the first <br> line (element) which begins <br> the page. |
| c | current <br> element | This is the current element <br> within the page. |
| row | This is the row of the display <br> on which the page is anchored. |  |
| h lines | This is the total number of <br> lines per page. |  |

These variables can be accessed by name or by their order in the temporary variables chain. If you know the entry points to recall and store temporary identifiers by their creation order, you can use them freely. The variables have been created in the order shown in the table above, that is $n$ is the fifth of the chain and $h$ is the first. To recall $h$ use entry point \#613B6h. However the safest way is to recall and store them by name.

Remember to change the current values according to underlying data structure. When PKMETA is running, on the stack there is only the body of the meta-object without the counter.

You can add or modify or change name simply modifying the ACTIONS list and updating, if necessary the KEYS list. All the customization of the command is with you.

Splits a program in its meta-object form.
A program is a collection of objects and pointers like a list or an algebraic expression. The main difference between programs and other composite object lies in its direct execution capability opposite to the indirect execution capabilities of lists and algebraics. Direct execution means that once the prolog of the program is executed, it starts executing objects within the program, while lists and algebraics merely push themselves on the stack. Once they are on the stack these objects can be executed via EVAL. Using PRG $\rightarrow$ you will be able to modify in whatever manner you want a compiled program, deleting, moving, changing the objects it contains. The possibility to modify compiled programs directly on the stack makes much faster editing session of large programs, typically when you need to swap objects or make little changes in the source. Nevertheless PRG $\rightarrow$ opens a wide range of applications dealing with program editing and in fact the SmartROM uses heavily this kind of commands. We suggest you try to edit a program via Interactive Stack.

May be you ramain quite surprised after expanding a User RPL program on the stack. In fact the built-in parser often adds hidden threads to perform safely dangerous operations like pushing an identifier on the stack unevaluated. Pay attention not to delete these hidden threads ! Moreover, as you will see, programming structures collect the commands between delimiters in a program object. To expand this kind of program, you need to move the object on the first level of the stack and call PRG $\rightarrow$ again, then after editing it, you must recontruct the program with $\rightarrow P R G$ and move back the program to the original position.

A nice thing about PRG $\rightarrow$ is that it can split also built-in functions and commands as SIN or STO. These commands appear, as any other internal program, as a stream of pointers to machine language routines and objects whose interpretation is impossible without commands like EXT $\rightarrow$. If you want to understand the difference between so-called functions and commands, read the Notes under command

$\rightarrow R$

| Category | Type Conversion |
| :--- | :--- |
| Affected by flag | -5 through -10 when the input is a binary integer |
| Input | $1: \quad<n h>\quad 1: \quad$ n $\quad 1: \quad$ Char |
| Output | $1: \quad n$ |
| Function | Converts the input number into a real. |
| Notes | $\rightarrow R$ accepts also real numbers as input. This feature sets |
| you free to use $\rightarrow R$ also when the object type should not |  |
| require any conversion. |  |

See Also $\rightarrow B, \rightarrow$ Char, EXT $\rightarrow, \rightarrow E X T, \rightarrow$ SYS

| Category | Stack Manipulation |
| :---: | :---: |
| Affected by flag | none |
| Input | N+2: $\mathrm{obj}_{1}$ |
|  | $\cdots \mathrm{T}+2 \mathrm{i}$ : $\quad$ obi |
|  |  |
|  | 3: ${ }_{\text {2 }} \quad \mathrm{obj}_{n}$ |
|  | 2: $1.0{ }^{\text {a }}$ |
| Output | $\mathrm{N}: \quad \mathrm{obj}{ }_{1}$ |
|  | $\cdots \mathrm{N} \cdot \mathrm{T}+1: \quad \cdots$ |
|  | N-T: ${ }_{\text {N }}$ |
|  |  |
|  | 1: obj ${ }_{\text {l }}$ |
| Function | Rolls down n objects t times. |
| Notes | The command is smart enough to choose the best roll direction (upwards or downwards). Rolling down 100 objects 99 times is a good exercise of aerobyc dance for your 48, but it is not that kind of exercise we really need to do. We had better to roll up 100 objects one time! |

| Category | String Function, List Manipulation and Program Editing |
| :---: | :---: |
| Affected by flag | none |
| Input | $\begin{array}{llllll} \text { 3: } & \text { str }_{1} & \text { 3: } & \text { Prg } & \text { 3: } & \text { List } \\ \text { 2: } & \text { str }_{2} & 2: & \text { obj }_{1} & 2: & \text { obj }_{1} \\ \text { 1: } & \text { str }_{3} & 1: & \text { obj }_{2} & 1: & \text { obj }_{2} \end{array}$ |
| Output | 2: str 2: Prg 2: List <br> 1: Replaced: 1: Replaced:n 1: Replaced:n |
| Function | Substitutes all the occurences of the search-key with the object or string given and returns the total number of replacements. |
| Notes | The replacements are limited to objects stored in user memory. Because some internal routines are recursive or reentrant, the search level is limited to threads stored in RAM. This preserves from endless loops. Internal routines of the SmartROM are able to perform selected substitutions at arbitrary depth within threads. Refer to the Hidden Commands Reference for more information on this topic. |

|  | REPLACE [ENTER] |
|  | 2: "HELLO HELLO HELLO" 1: Replaced: 3 |

Category String Manipulation
Affected by flag
-5 to - 10 (binary integers only)

Input
Output
Function

Notes Binary integers are reversed according with their actual size. User binary integers may be no longer than 16 nibbles (in hex mode). However the 48 can handle binary integers of arbitrary size. For example, when you apply BYTES to an object, the binary checksum you get is always 4 nibbles long, no matter the current wordsize is. Of course the display shows it according to the wordsize, but its size remains 4 nibbles.

RPT is one of the most flexible commands of the SmartROM. Thanks to its fast loop generator, it can link string and list quicker than any other command seen up to date. Try with a string of ten characters repeated 1000 times. You want believe to your eyes !

RPT is useful at most when you need to perform iterated operations without referencing counters. RPT does not mantain stack integrity, so that you can push or drop objects from the stack freely. If you have a DEMO program you want to iterate almost indefinitely, try this:

## 'DEMO' 1000000 RPT.

The loop normally cannot be interrupted. If you need to interrupt it press [ON] [C].

In the examples given below procedures are standard programs. Nevertheless you can push on the stack individual commands by doing so:
\{ MAX \} OBJ $\rightarrow$ DROP

String Manipulation
none

| 3: | str $_{1}$ |
| :--- | :--- |
| 2: | str $_{2}$ |
| 1: | pos |

1: pos
Returns the absolute position of the first character in $\mathrm{Str}_{1}$ not comprised in $\mathrm{Str}_{2}$, starting from position pos. If no match is found, returns 0 .

A typical usage of SPAN is when checking for the presence of extraneous characters, especially when the input string comes from the user. Suppose the user must enter a numeric value without decimal point and Exponent. To check the string you can do so:

3: "758833" This is the string given by the user.
2: "0123456789" This is the string containing allowed characters
1: 1
Beginning position

## SPAN [ENTER]

1: 0
Another frequent usage is when you need to skip blanks between words. In this case the test string must contain only a blank : " ". the position returned (if any) is that of next non-blank character. You could also ignore periods or any other punctuation by appending them to the test string.
".,"" lets you skip blanks, periods, commas and semicolons.

Frequently used string-constants has been stored in ROM to save memory:

DIGIT\$ = "0123456789"
alfaLOW $\$=$ "ABCDEFGH...XYZ"
alfaUPP\$ = "abcdefgh...xyz"
They are accessible in the fifth page of menu $\$ \& L$ in CST.

Affected by flag
none

Input

Output

| $N+1:$ | $o b j_{1}$ |
| :--- | :--- |
| $\ldots:$ | $\ldots$ |
| $2:$ | ob $_{n}$ |
| $1:$ | $n$ |

| $\mathrm{N}+1:$ | $\mathrm{obj}_{1}$ |
| :--- | :--- |
| $\ldots:$ | $\ldots$ |
| $\ldots:$ | $\mathrm{obj}_{\mathrm{n}}$ |
| 1: | $\mathrm{n}^{2}$ |

Function Sorts the data in ascending order.
Notes Objects must be compatible with the < operator (less
than). To this category of objects belong:
Global names
Real numbers
Binary integers
Strings
System Binaries
Tagged objects falling in one of the classes listed above
If you want to sort local names you need first to translate into global names, then use SRT and convert them back to Locals. To convert a Local name into a Global name back and forth use the following procedure:

```
#2464F SYSEVAL Local to Global
#2465F SYSEVAL Global to Local
```

To apply the translation to all the identifiers you can do the following:

| $\mathrm{N}+2:$ | Local |
| :--- | :--- |
| $\ldots:$ | $\ldots$ |
| $3:$ | Local |
| $2:$ | $n$ |
| $1:$ | $\{\# 2464 F h$ SYSEVAL \} |
| METOP [ENTER] |  |

The inverse function needs only \#2465Fh instead of \#2464Fh.

Symbolic values are not allowed. The hidden code is able to sort any data for that a sort procedure has been defined. This means that you could sort any object given a sort criterion. Refer to the Hidden Commands Reference for further information.

| Examples | 9: 8: 7: 6: 5: 4: 3: 2: $1:$ | "JOHN" <br> "MARY" <br> "JIM" <br> "STAN" <br> "FRED" <br> "paul" <br> "LUISE" <br> "HENRY <br> 8 |

## Appendix A

## Care of the SmartROM

The SmartROM does not require maintenance.

## Limited One Year Warranty

The SmartROM is warranted by Smart Technology against defects in materials and workmanship for one year from the date of original purchase. Warranty is automatically transferred to new owner if you sell the product or give it as a gift and remains in effect for the original one-year period. During the warranty period, we will repair or, at our option, replace at no charge a product that proves to be defective, provided you return the product, shipping prepaid, to Smart Technology.

The warranty does not apply if the product has been damaged by accident or misuse or as the result of service or modification by other than Smart Technology.

No other express warranty is given.
Smart Technology makes no express or implied warranty with regard to the software furnished. Programs are made available solely on an 'as is' basis and the entire risk as to its quality and performance is with the user. Should documentation and programs prove to be defective, the user (and not Smart Technology or any other party) shall bear the entire cost of all necessary correction and all incidental or consequential damages. Smart Technology shall not be liable for any incidental or consequential damages in connection with or arising out of the furnishing, use or performance of the documentation and programs.

## Service Center

Whether your unit is under warranty or not you can ship it for repair to our Service Center. If your warranty has expired, there will be a charge for the repair and for shipping costs.

The Service Center is located in Modena ITALY.

SMART TECHNOLOGY
Via Varese 67
41100 Modena, ITALY
phone 059-440404
fax 059-304490

Normally Your unit will be repaired within five (5) working days of receipt.

## Service Repair Charge

There is a standard repair price (STREP) for out-of-warranty repairs.

Out-of-Warranty units returned after repair are warranted for a limited 90 days period against defects in materials or workmanship.

## Shipping Instructions

If your unit requires service, please follow these shipping instructions:

- Include a description of the problem detected.
- If under warranty, include documentation proving the date of purchase or repair.
- Ship the unit in a protective packaging to prevent additional damages.

Shipping to Smart Technology is at your charge. Shipping costs to return the unit are paid by Smart Technology and will be included in the bill. On out-of-warranty repairs, the unit will be returned C.O.D.

## Technical Assistance

Smart Technology is committed to provide strong after-sale customer support. If you need specific information on this product or technical help on HP Calculators, you can call the number given above.

## Appendix B

## Objects structure

Object classification proposed herein follows the order estabilished by the system function TYPE. For each type of object internal code used by dispatching routines is given too.

Each object is composed of a Prolog, i.e. the header of the object that determines its behavior during direct or indirect evaluation and its data body along with its structure, total dimensions and characteristics.

Dimensions (length in nibbles) are given in the form: (Prolog ${ }_{5}$ )... (Data ${ }_{n}$ ). Each different item represents a logic unit whose length is specified in nibbles by the subscript.

Note that the 48 arranges data in memory in reverse order, so that the prolog is written with the least significant nibble coming first. All examples are given as they would appear in memory during a Memory Scanner session. If you don't know what the Memory Scanner is, save important data first and press [ON] [D] [BKSP].
[+] and [-] let you shift back and forth by 1 nibble. [*] and [/] let you skip over 256 nibbles.
[ $\uparrow$ ] and [ $\dagger$ ] let you skip over 4 K nibble at a time.
Never use [EVAL]! For more information on
Memory Scanner, check BBS contents on this topic or read the HP-48 Handbooks as those of James Donnelly and Bill Wickes.

## Real number

| Type | 0 |
| :---: | :---: |
| Internal Type | <1h> |
| Prolog | <02933h> |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Exponent $\left._{3}\right)\left(\right.$ Mantissa $\left._{12}\right)\left(\operatorname{Sign}_{1}\right)$ |
| Dimensions | 21 |
| Data | (Exponent3) |
|  | BCD Exponent in ten's complement (-500 to 500) |
|  | (Mantissa ${ }_{12}$ ) |
|  | BCD Mantissa |
|  | $\left(\operatorname{Sign}_{1}\right)$ |
|  | Sign: $0=$ positive, $9=$ negative |
| Example | 0 is equal to 339200000000000000000 |
|  | pi is equal to 339200009535629514130 |
|  | -1 is equal to 33290000000000000019 |
|  | -11 is equal to 332901000000000000119 |
|  | -. 5 is equal to 332909990000000000059 |

## Complex Number

| Type | 1 |
| :--- | :--- |
| Internal Type | $<2 \mathrm{~h}>$ |
| Prolog | $<02977 \mathrm{~h}>$ |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Exponent $\left._{3}\right)\left(\right.$ Mantissa $\left._{12}\right)\left(\right.$ Sign $\left._{1}\right)\left(\right.$ Exponent $\left._{3}\right)$ <br> $\left(\right.$ Mantissa $\left._{12}\right)\left(\right.$ Sign $\left._{1}\right)$ |
| Dimensions | 37 |
| Data | The Real part is composed by the first number while the <br> imaginary part comes next. Number representation is the same <br> as for reals. |

## String

| Type | 2 |
| :--- | :--- |
| Internal Type | $<3 \mathrm{~h}>$ |
| Prolog | $<02 \mathrm{~A} 2 \mathrm{Ch}>$ |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)$ (offset ${ }_{5}$ ) characters. |
| Dimensions | $5+$ offset |
| Data | The total number of characters is (offset-5)/2. (offset-5) must <br> always be an even number. |
| Notes | Characters are stored byte reversed. |
| Example | "ClAO" is equal to: $\quad$ C2A20D000034E414F4 |
|  | "" is equal to: |

## Real array

| Type | 3 |
| :---: | :---: |
| Internal Type | <4h> |
| Prolog | <02E48h> |
| Structure | (Prolog 5$)\left(\right.$ offset $\left._{5}\right)\left(\right.$ Real Prolog 5 ) $\left(\mathrm{n}-\right.$ dim $\left._{5}\right)\left(\operatorname{dim}_{1}\right) \ldots\left(\right.$ dim $\left._{n}\right)$ $\left(R_{1 \ldots 1}\right) \ldots\left(R_{\operatorname{dim} 1} \operatorname{dim}_{2} \ldots \operatorname{dim}_{n}\right)$ |
| Dimensions | $5+$ offset. |
| Data | Matrices are stored in row major order incrementing the rightmost counter faster. |
| Notes | It is possible to create n -dimensional order arrays. However there are no provisions in the system for handling individua elements when $n$ is greater than 2 . If you put on the stack a 3-dimensional array, you will get only "Array of reals". |

## Complex array

Type 4
Internal Type <4h>
Prolog <02E48h>

Structure $\quad\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ offset $\left._{5}\right)\left(\right.$ Complex Prolog $(\mathrm{n}$-dim) $)\left(\operatorname{dim}_{1}\right) \ldots\left(\operatorname{dim}_{n}\right)$ $\left(\operatorname{Cdim}_{1} 1 \ldots\right.$ 1) $\ldots\left(\operatorname{Cdim}_{1} \operatorname{dim}_{2} \ldots \operatorname{dim}_{n}\right)$

Dimensions $5+$ offset.
Data Matrices are stored in row major order incrementing the rightmost counter faster.

Notes It is possible to create n-dimensional order matrices. However there are no provisions in the system for handling individual elements when $n$ is greater than 2 . If you put on the stack a 3-dimensional array, you will get only "Array of complex".

## Array

| Type | 4 |
| :---: | :---: |
| Internal Type | <4h> |
| Prolog | <02E48h> |
| Structure | $\begin{aligned} & \left(\text { Prolog }_{5}\right)\left(\text { offset }_{5}\right)(\text { Data Prolog })(\mathrm{n}-\mathrm{dim})\left(\operatorname{dim}_{1}\right) \ldots\left(\operatorname{dim}_{n}\right) \\ & \left(\text { Data }_{1}\right) \ldots\left(\text { Data }_{n}\right) \end{aligned}$ |
| Dimensions | $5+$ offset. |
| Notes | You can create non-numeric arrays for storing type-homogeneous data. Unfortunately there are no provisions to handle efficiently this kind of objects. Error Messages in HIDE area are stored in several one-dimensional string arrays. If you want to store some data preserving it from editing, non-numeric arrays are a good place because of their inaccessibility. |

## List

Type 5
Internal Type <5h>

| Prolog | $<02 \mathrm{~A} 74 \mathrm{~h}>$ |
| :--- | :--- |
| Structure | $\left(\mathrm{Prolog}_{5}\right) \mathrm{Obj}_{1} \mathrm{Obj}_{2} \ldots \mathrm{Obj}_{\mathrm{n}}\left(\mathrm{End}_{5}\right)$ |
| Dimensions | $5+$ Length $\left(\mathrm{Obj}_{1}\right)+$ Length $\left(\mathrm{Obj}_{2}\right)+\ldots+$ Length $\left(\mathrm{Obj}_{\mathrm{n}}\right)+5$ |

Data A list is a composite object whose body is a sequence of objects or pointers to objects terminated by a special pointer <0312Bh>.

Notes The list object is similar to program objects and symbolic expressions. If you want to translate a Symbolic expression into a List, change its prolog to $<02 \mathrm{~A} 74 \mathrm{~h}>$. When you evaluate a List or a Symbolic Expression through EVAL special code is called to change the prolog of the composite object into the prolog of a program object.

| Example | $\}$ | is equal to |
| :--- | :--- | :--- |
| $\{1$ 4" $\}$ | is equal to | 47A20B2130 <br> or to |
|  | 47A209C2A2FD550B2130 |  |

## Global name

| Type | 6 |
| :--- | :--- |
| Internal Type | $<6 \mathrm{~h}>,<\mathrm{Ah}>$ |
| Prolog | $<02 \mathrm{E} 48 \mathrm{~h}>$ |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Length $\left._{2}\right)$ characters. |
| Dimensions | $7+($ Length $) * 2^{\text {Notes }}$ |
|  | Maximum lenght of an indentifier is 255 characters with no <br> restrictions on the name. However there are restrictions due to <br> the parser safety rules, which prevents you from creating <br> names conflicting with reserved variables used by the system. |
| Example | 'MARK is equal to $\quad 84 E 205072 \mathrm{D} 41425 \mathrm{B4}$ |

## Local name

| Type | 7 |
| :--- | :--- |
| Internal Type | $<7 \mathrm{~h}>$ |
| Prolog | $<02 \mathrm{E} 6 \mathrm{Dh}>$ |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Length $\left._{2}\right)$ characters. |
| Dimensions | $7+($ Length $) * 2^{\text {Notes }}$ |
| Example | See on the previous page. |
| matA is equal to $\quad$ D6E2040D6164714 |  |

## Program

| Type | 8 |
| :--- | :--- |
| Internal Type | $<8 \mathrm{~h}>$ |
| Prolog | <02D9Dh> |
| Structure | $\left(\right.$ Prolog $\left._{5}\right) \mathrm{Obj}_{1} \mathrm{Obj}_{2} \ldots \mathrm{Obj}_{\mathrm{n}}\left(\mathrm{End}_{5}\right)$ |
| Dimensions | $5+{\text { Length }\left(\mathrm{Obj}_{1}\right)+\text { Length }\left(\mathrm{Obj}_{2}\right)+\ldots+\text { Length }\left(\mathrm{Obj}_{n}\right)+5}^{\text {Notes }}$ |
|  | A program is a composite object whose body is a sequence of <br> objects or pointers to objects terminated by a special pointer <br> 8Bh. Main difference with List and Symbolic lies in its direct <br> execution capability. |
|  | Example |
|  | Internal program performing Rot Dup2 without stack <br> checking: |
|  | D9D2059230CA130B2130 |

## Algebraic

Type 9
Internal Type <9h>, <Ah>
Prolog <02AB8h>
Structure $\quad\left(\right.$ Prolog $\left._{5}\right) \mathrm{Obj}_{1} \mathrm{Obj}_{2} \ldots \mathrm{Obj}_{\mathrm{n}}\left(\right.$ End $\left._{5}\right)$
Dimensions $5+$ Length $\left(\mathrm{Obj}_{1}\right)+$ Length $\left(\mathrm{Obj}_{2}\right)+\ldots+$ Length $\left(\mathrm{Obj}_{\mathrm{n}}\right)+5$
Notes

Symbolic objects are similar to program objects and symbolic expressions. If you want to translate a Symbolic expression into a List, change its prolog to A74h. When you evaluate a List or a Symbolic Expression through EVAL, special code is called to change the prolog of the composite object into the prolog of a program object.

## Binary integer

| Type | 10 |
| :--- | :--- |
| Internal Type | <Bh> |
| Prolog | <02A4Eh> |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ offset $_{5}$ ) nibbles |
| Dimensions | $5+$ offset |
| Data | Raw nibbles. |
| Notes | Binary integers may exceed 64 bit width. However internal <br> arithmetic routines are tailored for handling 64 bit max <br> integers. Other internal routines (like Append or Size) work <br> well independently of integer length. A curious aspect of a <br> Library structure is that the execution, decompile and text <br> tables are stuffed in huge binary integers object. User defined <br> binary integers generally have a standard length of 16 nibbles <br> independently of the actual wordsize. |
|  | Example |
| This is the shortest form of |  |
|  | \#1234 wich translates to : |

## Graphic object

| Type | 11 |
| :---: | :---: |
| Internal Type | <Ch> |
| Prolog | <02B1Eh> |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Offset $\left._{5}\right)\left(\right.$ Rows $\left._{5}\right)\left(\right.$ Columns $\left._{5}\right)$ nibbles |
| Dimensions | $5+$ offset. |
| Data | Graphics objects are stored in row major order using a bit for each pixel on a byte-aligned scheme. Thus, each row of pixel must have an even number of nibbles eventually padding with garbage bits the last byte. The least significant bit of each nibble represents the leftmost pixel of 4 pixel block. |
|  | Example |
|  | Take the character A in the font ROM8x14: |
|  | ```E1B20B2000E00008000000000183C66C6CEF6C6C6C0 00000``` |
|  | $1 . . . .00$ |
|  | 2 ...... 00 |
|  | 3 ...*... 01 |
|  | 4 ...***.. 83 |
|  | 5 ..**.**. C6 |
|  | 6 .**...** 6C |
|  | 7 .***..** 6C |
|  | 8 . ******* EF |
|  | 9 .**..** 6C |
|  | A .**..** 6C |
|  | B .**..** 6C |
|  | C ..... 00 |
|  | D ..... 00 |
|  | E ..... 00 |

## Tagged object

Type 12
Internal Type <Dh>
Prolog
Structure
$\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Length $\left._{2}\right)$ characters Obj
Dimensions
7 + (Length) * $2+$ Length(Obj)
Notes

Example
Tagged objects does not inherit the behavior of the ancestor type unless you make a recursive call to the routine being executed after deleting the tag.

PIGREEK: 3.14159265359 is represented by :
CFA2070059474255454B4339200009535629514130

## Unit

| Type | 13 |
| :---: | :---: |
| Internal Type | <Eh> |
| Prolog | <02ADAh> |
| Structure | (Prolog ${ }_{5}$ ) (value) (string) ... (string) (oper5) ... (oper5) (End ${ }_{5}$ ) |
| Dimensions | $\begin{aligned} & 5+21+\text { Length(string) }+\ldots+\text { Length(string) }+5 * \text { num(oper) } \\ & +5 \end{aligned}$ |
| Example | 1.5129 _m^2 is equal to: |
|  | ADA20339200000000000921510C2A20700006ED2A227 B0168B01B2130 |

## Xlib name

| Type | 14 |
| :---: | :---: |
| Internal Type | <0Fh> |
| Prolog | <02E92h> |
| Structure | $\left(\operatorname{Prolog}_{5}\right)\left(\mathrm{LID}_{3}\right)\left(\mathrm{Num}_{3}\right)$ |
| Dimensions | 11 |
| Data | External Library Names are uniquely identified by a Library Identification Number and a library-local command number. System User commands are double-face. They have a fixed address pointer which allows faster execution and memory-saving storage. However if you put a command on the stack and store it in a global name in order to send it to a PC, special code in the STO command changes the address pointer of the command into the respective External Library Name to avoid transferring rom-based code. |

## Directory

Type
Internal Type <2Fh>
Prolog
Structure

## Dimensions

Data

Object are stored in reverse order. (offset ${ }_{1}$ ) points to the field (offset ${ }_{2}$ ) at the bottom of the directory where lies the first object. A sequence of backward offsets lets you jump like a frog till the last object at the top of the directory. The last offset field $(00000)$ marks the end of the chain. The Attach field retains the Library identification number of one Library. In the Home directory this field counts the number of library actually attached to the HOME dir.

## Library

| Type | 16 |
| :---: | :---: |
| Internal Type | <8Fh> |
| Prolog | <02B40h> |
| Structure | (Prolog ${ }_{5}$ ) (offset5) (Length 2) Characters $\left(\mathrm{LID}_{3}\right)$ (Offset TexTTbl 5) (Offset MsgTbl 5) (Offset LinkTbl 5) (Offset Conf 5) Nibbles (Cksum 4) |
| Dimensions | $5+$ offset |
| Data | (Length 2) Characters Library Title. |
|  | $\left(\mathrm{LID}_{3}\right) \quad$ Library IDentification number. |
|  | (Offset TextTb ${ }_{5}$ ) <br> Offset to a binary integer containing command names text. The table begins with 16 field of 5 nibbles ( 80 nibbles total) each one of them pointing to the first command of a given length. The first field points to the first command (in alphabetical order) of length 1. |
|  | Offset to the table of messages. The table is contained in a string-array. |
|  | Offset to a binary integer containing all the exccutable code of commands. |
|  | Offset to the configuration program of the library. |
|  | Nibbles Library contents. |
|  | (Cksum 4) Checksım. |

## Backup

Type 17
Internal Type <9Fh>
Prolog <02B62h>
Structure $\quad\left(\right.$ Prolog $\left._{5}\right)$ (offset 5) (Length 2) characters nibbles
Dimensions $5+$ offset
Notes Backup objects normally exist only in memory ports.

## System function

Type 18

Internal Type <8h>
Prolog <02E92h>
Structure $\quad\left(\right.$ Prolog $\left._{5}\right)\left(\mathrm{LID}_{3}\right)\left(\mathrm{Num}_{3}\right)$
Dimensions 11
Data A rom-based program is recognized as function when a special code precedes its execution address. Formerly it is a normal program object but it receives special handling by the parser and decompile routines when you enter formulas in algebraic style. The process of recognizing algebraic functions is a bit tricky and this is not the best place where place an exhaustive explanation. There are several bits specifying analytic properties like differentiability and others specifing if the program is a command or a function and where to place the decompiled text (before, between or after). The study of USAG program can be very helpful if you are interested.

Example
SIN (system function) is identified by XLIB 2 81. Its special header is CC 0 and precedes the LID program in ROM. If you scan memory a little before location B4ACh, you will see the following sequence:

CC0200150D9D20....
CC0 means integrable, invertible, differentiable, function.
Thanks to this encoding system, adding external function is very, very hard.

## System Command

Type 19
Internal Type <8h>
Prolog <02E92h>
Structure $\quad\left(\right.$ Prolog $\left._{5}\right)\left(\mathrm{LID}_{3}\right)\left(\mathrm{Num}_{3}\right)$
Dimensions 11
Data A rom-based program is recognized as built-in command when a special code precedes its execution address. Most commands have a single nibble header (added to the six specifying the Library ID and number) whose value is 8 . It seems that the most significant bit of this nibble play a key-role in the game. If this bit is 0 , the program is some kind of function. The study of USAG program can be very helpful if you are interested.

Example STO (system command) is identified by XLIB 2341.

## System binary

Type 20

Internal Type <1Fh>
Prolog <02911h>
Structure $\quad\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Nibble $\left._{5}\right)$
Dimensions 10
Data System binaries are the most used numeric entities throughout the Operating System. Providing a faster throughput than real numbers and smaller storage requirements, they are the optimum choice for the system programmer.

Example FFFFFh is equal to 11920FFFFF
12345 h is equal to 1192054321

## Long real

| Type | 21 |
| :--- | :--- |
| Internal Type | $<3 \mathrm{Fh}>$ |
| Prolog | $<02955 \mathrm{~h}>$ |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Exponent $\left._{5}\right)\left(\right.$ Mantissa $\left._{15}\right)\left(\mathrm{Sign}_{1}\right)$ |
| Dimensions | 26 |
| Data | $\left(\right.$ Exponent $\left._{5}\right)$ |
|  | Exponent BCD in ten's complement (from -50000 to 50000) |
|  | $($ Mantissa 15) |
|  | BCD Mantissa |
|  | $\left(\right.$ Sign $\left._{1}\right)$ |
|  | Sign: $0=$ positive, $9=$ negative |
|  | Extended precision PI is equal to |
| Example | 55920000009798535629514130 |

## Long complex

| Type | 22 |
| :--- | :--- |
| Internal Type | $<4 \mathrm{Fh}>$ |
| Prolog | $<0299 \mathrm{Dh}>$ |
| Structure | $\left(\right.$ Prolog$\left._{5}\right)\left(\right.$ Exponent $\left._{5}\right)\left(\right.$ Mantissa $\left._{15}\right)\left(\operatorname{Sign}_{1}\right)\left(\right.$ Exponent $\left._{5}\right)$ <br> $\left(\right.$ Mantissa $\left._{15}\right)\left(\right.$ Sign $\left._{1}\right)$ |
| Dimensions | 47 |
| Data | Real part comes first, next the imaginary part. The number <br> encoding system is the same as for Extended Reals. |

## Linked array

## Type 23

Internal Type <5Fh>
Prolog <02A0Ah>

Dimensions $5+$ Offset.
Data This is one of the most esoteric data structures built in the 48.
In the 256 K of the operating system, there is no evidence of its existence. It seems that this structure is suitable for sparse arrays because a missing element is represented by a 00000 pointer. If you have more amazing news about it, we will be glad to hear from you.

## Character

| Type | 24 |
| :--- | :--- |
| Internal Type | $<6 \mathrm{Fh}>$ |
| Prolog | $<029 \mathrm{BFh}>$ |
| Structure | $\left(\mathrm{Prolog}_{5}\right)\left(\mathrm{Byte}_{2}\right)$ |
| Dimensions | 7 |
| Data | Contains a single-byte (a character) byte reversed. |
| Example | Letter A is represented by : FB92014 |

## Code

Type 25

Internal Type <7Fh>
Prolog <02DCCh>
Structure $\quad\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ Offset $\left._{5}\right)$ Nibbles
Dimensions 5 + Offset
Data The code starts at the first nibble of the body. Execution is transferred to this location by the prolog of the object.

Notes See the Appendix C for an explanation of the Saturn Assembly Language.

Example The routine DONOTHING:
$A=$ DATO A
$\mathrm{DO}=\mathrm{DO}+5$
$\mathrm{PC}=(\mathrm{A})$
Read the address of next object Updates Thread pointer. Skip to next execution address.
written in memory:
CCD20F0000142164808C

## Library data

| Type | 26 |
| :--- | :--- |
| Internal Type | $<$ AFh> |
| Prolog | $<02 \mathrm{~B} 88 \mathrm{~h}>$ |
| Structure | $\left(\right.$ Prolog $\left._{5}\right)\left(\right.$ offset $\left._{5}\right)\left(\mathrm{LID}_{3}\right)\left(\mathrm{num}_{3}\right) \mathrm{Obj}_{1} \mathrm{Obj}_{2} \ldots \mathrm{Obj}_{\mathrm{n}}\left(\mathrm{End}_{5}\right)$ |
| Dimensions | $5+$ Offset |
| Data | Libraries may use this kind of object when they want to <br> preserve data from editing till the next library call. Data <br> appear on the stack merely as 'Library Data'. |

## Address

| Type | 27 |
| :--- | :--- |
| Internal Type | 0 h |
| Prolog | <hhhhh> |
| Structure | (Prolog ${ }_{5}$ ) |
| Dimensions | 5 |
| Data | Any object not mentioned before falls in this category. <br> Whether it is possible (and safe) to add new object types to the <br> HP-48 RPL is not clear. Theoretically it should be. Under <br> normal circumstancies, this category represents atomic <br> threads. An atomic thread is an address where machine <br> language code begins. Built in machine language routines <br> (callable as RPL routines) have the following form: |
|  | Addr Addr+5 |
|  | Prolog Nibbles.... |

Prolog is a 5 nibble offset to the location where Saturn codes begin. By convention it should be Addr +5 , but some routines violate this convention to implement hyper-compact Dup'n Go routines.

## Appendix C

## The Saturn microprocessor

The microprocessor being used in the HP-48 family of calculators is the evolution of the HP-71 handheld computer and HP-28 pocket calculator. It is a low power consumption CPU, optimized for BCD calculation. Memory Addressing limit is, theoretically, 1 M nibbles, that is 512 Kbytes. With the help of bank switching software techniques the 1 Mb nibble barrier can be broken. Tripod Data Systems memory cards reach 512 K bytes on a single card, by exploiting these software tricks.

The Saturn Assembly Language Instruction Set explained on the following pages follows HP's original Saturn Assembler Internal Design Specification as it is documented in the HP-71 Hardware Internal Design Specification. Mnemonics added after the release of the HP-71 documentation are the same accepted by HP's unsupported Saturn Compiler available at EduCALC (Goodies disc n ${ }^{\circ} 4$ ).

## Microprocessor's registers

The CPU is organized in several registers with different characteristics and power.

Scratch Registers

Arthmetic Registers

There are five temporary registers (Scratch Registers) of 64 bit length called R0, R1, R2, R3 and R4. These registers serve as storage area during operations. It is possible to read and write on specific fields ranging from 1 nibble up to the whole register.

Four arithmetic registers (A, B, C and D) of 64 bit lentgh. These are the working registers. Each one of these registers can be accessed through the following fields:

| Field Name | Length in <br> nibbles | Length <br> in bits | Meaning |
| :--- | :--- | :--- | :--- |
| W | 16 | 64 | WORD |
| A | 5 | 20 | ADDRESS |
| B | 2 | 8 | BYTE |
| M | 12 | 48 | MANTISSA |
| S | 1 | 4 | SIGN |
| X | 3 | 12 | EXPONENT |
| XS | 1 | 4 | EXPONENT SIGN |
| P | 1 | 4 | POINTER |
| WP | $P+1$ | $(P+1)^{*} 4$ | WORD THROUGH <br> Pointer |

Control registers

ST Status Register. It si a 16 bit register, where the four most significant bits (from bit 12 to 15 ) are normally accessed only by the operating system.

PC Program Counter, 20 bit register controlling the execution flow. It is accessible indirectly.

RSTK Return Stack. It is a (LIFO) stack with 8 levels of 20 bit where subroutine return addresses are automatically pushed. It can be accessed also through register C.

P Pointer, 4 bit register specifying a nibble within arithmetic or scratch registers. Register $P$ determines also the length of field WP.

Do Address register. 20 bit register for addressing data in memory.

D1 Address register. 20 bit register for addressing data in memory.

IN Input Register. 16 bit read-only register used by the system to control the keyboard.

OUT Ouptut Register. 12 bit write-only register used by the system to enable the keyboard and the beeper.

SB Sticky Bit. 1 bit field of Hardware Status Register whose value is determined by right shift operations of arithmetic registers.

SR Service Request Bit. 1 bit field of Hardware Status Register whose value is determined by external events.

MP Module Pulled Bit. 1 bit field of Hardware Status Register whose value is determined by the pulling or pushing of hardware modules.

XM External Module Missing Bit. 1 bit field of Hardware Status Register whose value is determined by software.

## Saturn Assembly Language Mnemonics

## Legenda

The conventions explained herein are used in the following pages to represent parameters and values which may vary in a certain range.

## Symbol Meaning

a Hex digit which represents a number in the range 0-7 used in the instruction opcode.
b Hex digit which represents a number in the range 8-F used in the instruction opcode.
d Decimal digit whose value ranges from 1 to 16 . The assembler diminishes it automatically by one.
ts $\quad$ Field selection ( $B, X, X S$ and so on).
hh...h Up to 16 hex digits.

## Field Selection Table

Often in the instruction table fields are referred to as fs. In order to isolate a specific field, you need to know exactly the
value of a specific digit in the opcode. The following table summarizes the convention.

| Field | Opcode value |  | Length |
| :--- | :--- | :--- | :--- |
|  | (a) | (b) | (d) |
| P | 0 | 8 | 1 |
| WP | 1 | 9 | (P) +1 |
| XS | 2 | A | 1 |
| X | 3 | B | 3 |
| S | 4 | C | 1 |
| M | 5 | D | 12 |
| B | 6 | E | 2 |
| W | 7 | F | 16 |

## Opcodes vs Mnemonics

This is the complete reference to all Saturn opcodes.

## Appendix D

## System Calls

The Appendix lists the addresses of system entry points.

There is no warranty that a system call will work under any circumstance, thus we shall be not liable for incidental damages or loose of data consequential to the use of this documentation.

This material has been created using Smart Technology proprietary development system. In some cases may be there are some differences of interpretation respect to BBS listings.

## Appendix E

## Error Messages

The following error messages are unique to the SmartROM:

Error number Error Message
33501 Conformability
33502 Type Mismatch
33503 Invalid Sub-List
33504 Argument Out Of Range
33505 KEYS/ACTIONS mismatch
33506 Missing Var
$\left.\begin{array}{ll}\text { Conformability } & \begin{array}{l}\text { Issued when two matrices are not compatible for } \\ \text { row-by-column multiplication. Given a matrix } \\ \text { A(m,n), the second must have the form B(n,p). }\end{array} \\ \text { Type Mismatch } & \begin{array}{l}\text { Issued when a meta-object contains objects of } \\ \text { different types. This restriction is checked by some } \\ \text { commands when type homogeneity is required. A } \\ \text { typical example is SRT. }\end{array} \\ \text { Invalid Sub-List } & \begin{array}{l}\text { Issued when a list-matrix contains rows of different } \\ \text { size. }\end{array} \\ \text { Subscript Out Of } & \begin{array}{l}\text { Issued when a subscript in a list-matrix overflows or } \\ \text { underflows its valid range. }\end{array} \\ \text { Range } & \begin{array}{l}\text { Issued when the length of the lists KEYS and }\end{array} \\ \text { KEYS/ACTIONS } \\ \text { ACTIONS are not compatible. Length(ACTIONS) } \\ \text { := Length(KEYS)+1 }\end{array}\right\}$

## Appendix H

## Hidden Commands

This appendix contains the complete list of SmartROM hidden commands arranged in logic categories for easier referencing. Each command along with its entry and exit conditions is discussed in detail in the SmartROM Hidden Commands Reference.
