## Contents

## Part 1. Basic Operation

## 1. Getting Started

Important Preliminaries ..... 1-1
Turning the Calculator On and Off ..... 1-1
Adjusting Display Contrast ..... 1-1
Highlights of the Keyboard and Display ..... 1-2
Shifted Keys ..... 1-2
Alpha Keys ..... 1-3
Cursor Keys ..... 1-3
Silver Paint Keys ..... 1-4
Backspacing and Clearing ..... 1-4
Using Menus ..... 1-7
Exiting Menus ..... 1-9
RPN and ALG Keys ..... 1-10
The Display and Annunciators ..... 1-11
Keying in Numbers ..... 1-14
Making Numbers Negative ..... 1-14
Exponents of Ten ..... 1-14
Understanding Digit Entry ..... 1-15
Range of Numbers and OVERFLOW ..... 1-16
Doing Arithmetic ..... 1-16
One-Number Functions ..... 1-17
Two-Number Functions ..... 1-17
Controlling the Display Format ..... 1-18
Periods and Commas in Numbers ..... 1-18
Number of Decimal Places ..... 1-19
SHOWing Full 12-Digit Precision ..... 1-20
Fractions ..... 1-21
Entering Fractions ..... 1-21
Displaying Fractions ..... 1-23
Messages ..... 1-23
Calculator Memory ..... 1-24
Checking Available Memory ..... 1-24
Clearing All of Memory ..... 1-24
2. RPN: The Automatic Memory Stack
What the Stack Is ..... 2-1
The $X$ and $Y$-Registers are in the Display ..... 2-2
Clearing the X -Register ..... 2-2
Reviewing the Stack ..... 2-3
Exchanging the X - and Y -Registers in the Stack ..... 2-4
Arithmetic - How the Stack Does It ..... 2-4
How ENTER Works ..... 2-5
How CLEAR x Works ..... 2-6
The LAST X Register ..... 2-7
Correcting Mistakes with LAST X. ..... 2-8
Reusing Numbers with LAST X. ..... 2-9
Chain Calculations in RPN mode ..... 2-11
Work from the Parentheses Out ..... 2-11
Exercises ..... 2-13
Order of Calculation ..... 2-13
More Exercises ..... 2-14
3. Storing Data into Variables
Storing and Recalling Numbers ..... 3-2
Viewing a Variable without Recalling It ..... 3-3
Reviewing Variables in the VAR Catalog ..... 3-3
Clearing Variables ..... 3-4
Arithmetic with Stored Variables ..... 3-4
Storage Arithmetic ..... 3-4
Recall Arithmetic ..... 3-5
Exchanging x with Any Variable ..... 3-6
The Variable "i" ..... 3-7
4. Real-Number Functions
Exponential and Logarithmic Functions ..... 4-1
Quotient and Remainder of Division ..... 4-2
Power Functions ..... 4-2
Trigonometry ..... 4-3
Entering $\pi$ ..... 4-3
Setting the Angular Mode ..... 4-4
Trigonometric Functions ..... 4-4
Hyperbolic Functions ..... 4-6
Percentage Functions ..... 4-6
Physics Constants ..... 4-8
Conversion Functions ..... 4-9
Coordinate Conversions ..... 4-10
Time Conversions ..... 4-12
Angle Conversions ..... 4-13
Unit Conversions ..... 4-13
Probability Functions ..... 4-14
Factorial ..... 4-14
Gamma ..... 4-14
Probability ..... 4-14
Parts of Numbers ..... 4-16
Names of Functions ..... 4-17
5. Fractions
Entering Fractions ..... 5-1
Fractions in the Display ..... 5-2
Display Rules ..... 5-2
Accuracy Indicators ..... 5-3
Longer Fractions ..... 5-4
Changing the Fraction Display ..... 5-4
Setting the Maximum Denominator ..... 5-5
Choosing a Fraction Format ..... 5-5
Examples of Fraction Displays ..... 5-6
Rounding Fractions ..... 5-7
Fractions in Equations ..... 5-8
Fractions in Programs ..... 5-9
6. Entering and Evaluating Equations
How You Can Use Equations ..... 6-1
Summary of Equation Operations ..... 6-3
Entering Equations into the Equation List ..... 6-4
Variables in Equations ..... 6-4
Numbers in Equations ..... 6-5
Functions in Equations ..... 6-5
Parentheses in Equations ..... 6-6
Displaying and Selecting Equations ..... 6-6
Editing and Clearing Equations ..... 6-7
Types of Equations ..... 6-9
Evaluating Equations ..... 6-9
Using ENTER for Evaluation ..... 6-11
Using XEQ for Evaluation ..... 6-12
Responding to Equation Prompts ..... 6-12
The Syntax of Equations ..... 6-13
Operator Precedence ..... 6-13
Equation Functions ..... 6-15
Syntax Errors ..... 6-18
Verifying Equations ..... 6-18
7. Solving Equations
Solving an Equation ..... 7-1
Understanding and Controlling SOLVE ..... 7-5
Verifying the Result ..... 7-6
Interrupting a SOLVE Calculation ..... 7-7
Choosing Initial Guesses for SOLVE ..... 7-7
For More Information ..... 7-11
8. Integrating Equations
Integrating Equations ( $\int$ FN) ..... 8-2
Accuracy of Integration ..... 8-5
Specifying Accuracy ..... 8-6
Interpreting Accuracy ..... 8-6
For More Information ..... 8-8
9. Operations with Complex Numbers
The Complex Stack ..... 9-1
Complex Operations ..... 9-2
Using Complex Numbers in Polar Notation ..... 9-5
10. Base Conversions and Arithmetic
Arithmetic in Bases 2, 8, and 16 ..... 10-2
The Representation of Numbers ..... 10-4
Negative Numbers ..... 10-4
Range of Numbers ..... 10-5
Windows for Long Binary Numbers ..... 10-6
11. Statistical Operations
Entering Statistical Data ..... 11-1
Entering One-Variable Data ..... 11-2
Entering Two-Variable Data ..... 11-2
Correcting Errors in Data Entry ..... 11-2
Statistical Calculations ..... 11-4
Mean ..... 11-4
Sample Standard Deviation ..... 11-6
Population Standard Deviation ..... 11-6
Linear Regression ..... 11-7
Limitations on Precision of Data ..... 11-9
Summation Values and the Statistics Registers ..... 11-10
Summation Statistics ..... 11-10
The Statistics Registers in Calculator Memory ..... 11-11
Access to the Statistics Registers ..... 11-11
Part 2. Programming
12. Simple Programming
Designing a Program ..... 12-3
Selecting a Mode ..... 12-3
Program Boundaries (LBL and RTN) ..... 12-3
Using RPN, ALG and Equations in Programs ..... 12-4
Data Input and Output ..... 12-4
Entering a Program ..... 12-5
Keys That Clear ..... 12-6
Function Names in Programs ..... 12-7
Running a Program ..... 12-9
Executing a Program (XEQ) ..... 12-9
Testing a Program ..... 12-9
Entering and Displaying Data ..... 12-11
Using INPUT for Entering Data ..... 12-11
Using VIEW for Displaying Data ..... 12-13
Using Equations to Display Messages ..... 12-14
Displaying Information without Stopping ..... 12-16
Stopping or Interrupting a Program ..... 12-17
Programming a Stop or Pause (STOP, PSE) ..... 12-17
Interrupting a Running Program ..... 12-17
Error Stops ..... 12-17
Editing a Program ..... 12-18
Program Memory ..... 12-19
Viewing Program Memory ..... 12-19
Memory Usage ..... 12-20
The Catalog of Programs (MEM) ..... 12-20
Clearing One or More Programs ..... 12-20
The Checksum ..... 12-21
Nonprogrammable Functions ..... 12-22
Programming with BASE ..... 12-22
Selecting a Base Mode in a Program ..... 12-22
Numbers Entered in Program Lines ..... 12-23
Polynomial Expressions and Horner's Method ..... 12-23
13. Programming Techniques
Routines in Programs ..... 13-1
Calling Subroutines (XEQ, RTN) ..... 13-2
Nested Subroutines ..... 13-3
Branching (GTO) ..... 13-4
A Programmed GTO Instruction ..... 13-5
Using GTO from the Keyboard ..... 13-5
Conditional Instructions ..... 13-6
Tests of Comparison ( $x ? y, x ? 0$ ) ..... 13-7
Flags ..... 13-8
Loops ..... 13-16
Conditional Loops (GTO) ..... 13-17
Loops with Counters (DSE, ISG) ..... 13-18
Indirectly Addressing Variables and Labels ..... 13-20
The Variable "i" ..... 13-20
The Indirect Address, (i) ..... 13-21
Program Control with (i) ..... 13-22
Equations with (i) ..... 13-24
14. Solving and Integrating Programs
Solving a Program ..... 14-1
Using SOLVE in a Program ..... 14-6
Integrating a Program ..... 14-7
Using Integration in a Program ..... 14-9
Restrictions on Solving and Integrating ..... 14-11
15. Mathematics Programs
Vector Operations ..... 15-1
Solutions of Simultaneous Equations ..... 15-12
Polynomial Root Finder ..... 15-20
Coordinate Transformations ..... 15-32
16. Statistics Programs
Curve Fitting ..... 16-1
Normal and Inverse-Normal Distributions ..... 16-11
Grouped Standard Deviation ..... 16-17
17. Miscellaneous Programs and Equations
Time Value of Money ..... 17-1
Prime Number Generator ..... 17-6
Part 3. Appendixes and Reference
A. Support, Batteries, and Service
Calculator Support ..... A-1
Answers to Common Questions ..... A-1
Environmental Limits ..... A-2
Changing the Batteries ..... A-2
Testing Calculator Operation ..... A-4
The Self-Test ..... A-5
Warranty ..... A-6
Service ..... A-7
Regulatory Information ..... A-9
B. User Memory and the Stack
Managing Calculator Memory ..... B-1
Resetting the Calculator ..... B-2
Clearing Memory ..... B-3

How the Integral Is Evaluated ..... E-1
Conditions That Could Cause Incorrect Results ..... E-2
Conditions That Prolong Calculation Time ..... E-7
F. Messages
G. Operation Index
Index

## Part 1

## Basic Operation

## 1

## Getting Started

Watch for this symbol in the margin. It identifies examples or keystrokes that are shown in RPN mode and must be performed differently in ALG mode.
Appendix C explains how to use your calculator in ALG mode.

## Important Preliminaries

## Turning the Calculator On and Off

To turn the calculator on, press $[$. ON is printed below the key.
To turn the calculator off, press OFF. That is, press and release the $\rightarrow$ shift key, then press ( $C$ (which has OFF printed in purple above it). Since the calculator has Continuous Memory, turning it off does not affect any information you've stored.
To conserve energy, the calculator turns itself off after 10 minutes of no use. If you see the low-power indicator ( $\curvearrowleft$ ) in the display, replace the batteries as soon as possible. See appendix A for instructions.

## Adjusting Display Contrast

Display contrast depends on lighting, viewing angle, and the contrast setting. To increase or decrease the contrast, hold down the $\square \square$ key and press $\square$ or $\square$.

## Highlights of the Keyboard and Display

## Shifted Keys

Each key has three functions: one printed on its face, a left-shifted function (Green), and a right-shifted function (Purple). The shifted function names are printed in green and purple above each key. Press the appropriate shift key ( $\boxed{\Omega}$ or $\rightarrow$ ) before pressing the key for the desired function. For example, to turn the calculator off, press and release the $\rightarrow$ shift key, then press $\mathbb{C}$.

Pressing $\square \boldsymbol{\square}$ or turns on the corresponding $\boldsymbol{\square} \boldsymbol{\square}$ annunciator symbol at the top of the display. The annunciator remains on until you press the next key. To cancel a shift key (and turn off its annunciator), press the same shift key again.

## Alpha Keys

Most keys have a letter written next to them, as shown above. Whenever you need to type a letter (for example, a variable or a program label), the A..Z annunciator appears in the display, indicating that the alpha keys are "active".

Variables are covered in chapter 3; labels are covered in chapter 12.

## Cursor Keys

Note that the cursor key itself is not actually marked with arrows. To make the explanations in this manual as easy to understand as possible, we will refer to specific cursor keys as noted in the illustration below.

## Silver Paint Keys

Those eight silver paint keys have their specific pressure points marked in blue position in the illustration below.

To use those keys, make sure to press down the corresponding position for the desired function.

## Backspacing and Clearing

One of the first things you need to know is how to clear: how to correct numbers, clear the display, or start over.

## Keys for Clearing

| Key | Description |
| :---: | :---: |
| $\square$ | Backspace. <br> Keyboard-entry mode: <br> Erases the character immediately to the left of "_" (the digit-entry cursor) or backs out of the current menu. (Menus are described in "Using Menus" on page 1-7.) If the number is completed (no cursor), clears the entire number. <br> Equation-entry mode: <br> Erases the character immediately to the left of "ח" (the equation-entry cursor). If a number entry in your equation is complete, $\square$ erases the entire number. If the number is not complete, $\longleftarrow$ erases the character immediately to the left of "_" (the number-entry cursor). "_" changes back to "■" when number entry is complete. <br> $\longleftarrow$ also clears error messages, and deletes the current program line during program entry. <br> Clear or Cancel. <br> Clears the displayed number to zero or cancels the current situation (such as a menu, a message, a prompt, a catalog, or Equation-entry or Program-entry mode). |

## Keys for Clearing (continued)

| Key | Description |
| :---: | :---: |
| ( CLEAR | The CLEAR menu ( $\{\times\}$ \{VPRS $\}$ \{ALL $\}\{\Sigma\}$ ) <br> Contains options for clearing x (the number in the X -register), all variables, all of memory, or all statistical data. <br> If you select \{PLL\}, a new menu (CLR PLL? \{ $\left\{\begin{array}{r} \\ G\end{array}\{\dot{H}\}\right.$ ) is displayed so you can verify your decision before erasing everything in memory. <br> During program entry, $\{\mathrm{PLL}\}$ is replaced by $\{\mathrm{PCCH}\}$. If you select $\{\mathrm{FGM}\}$, a new menu (CLR PEMS? \{Y\} $\{\mathrm{H}\}$ ) is displayed, so you can verify your decision before erasing all your programs. <br> During equation entry (either keyboard equations or equations in program lines), the CLR EQH? \{ $\left.\mathrm{Y}^{\prime}\right\}\left\{\begin{array}{l}\mathrm{H}\} \\ \}\end{array}\right.$ menu is displayed, so you can verify your decision before erasing the equation. <br> If you are viewing a completed equation, the equation is deleted with no verification. |

## Using Menus

There is a lot more power to the HP 33s than what you see on the keyboard. This is because 14 of the keys are menu keys. There are 14 menus in all, which provide many more functions, or more options for more functions.

## HP 33s Menus

| Menu Name | Menu Description | Chapter |
| :---: | :---: | :---: |
| L.R. | Numeric Functions | 11 |
|  | $\hat{x} \hat{y} \times \mathrm{mb}$ |  |
| $\bar{x}, \bar{y}$ | Linear regression: curve fitting and linear estimation. $\bar{x} \bar{x} \bar{x}$ | 11 |
|  | Arithmetic mean of statistical $x$ - and $y$-values; weighted mean of statistical $x$-values. |  |
| $s, \sigma$ | $s \times s y \sigma^{\times} \sigma^{y}$ | 11 |
|  | Sample standard deviation, population standard deviation. |  |
| CONST | Functions to use 40 physics constants-refer to <br> " Physics constants" on page 4-8. | 4 |
| SUMS | $\square \Sigma \times \Sigma y \Sigma x^{2} \Sigma y^{2} z \times y$ | 11 |
|  | Statistical data summations. |  |
| BASE | DEC HEX OCT BIN | 11 |
|  | Base conversions (decimal, hexadecimal, octal, and binary). |  |
|  | Programming Instructions |  |
| FLAGS | SF CFFS? | 13 |
|  | Functions to set, clear, and test flags. |  |
| $x ? y$ | $\neq \leq<>\geq=$ <br> Comparison tests of the X -and Y -registers. | 13 |
| $x ? 0$ | $\neq \leq<>\geq=$ <br> Comparison tests of the X -register and zero. | 13 |

HP 33s Menus (continued)

| Menu Name | Menu Description | Chapter |
| :---: | :---: | :---: |
|  | Other functions |  |
| MEM | VAR PEM | 1, 3, 12 |
|  | Memory status (bytes of memory available); catalog of variables; catalog of programs (program labels). |  |
| MODES | DEGRAD ERAD. | 4, 1 |
|  | Angular modes and " " " or " " " radix (decimal point) convention. |  |
| DISPLAY | FIX SCI EHE PLL | 1 |
|  | Fix, scientific, engineering, and ALL display formats. X1 82 $83 \times 4$ |  |
|  | Functions to review the stack in ALG mode -X1-, X2-, X3-, X4-registers |  |
| CLEAR | Functions to clear different portions of memory-refer to CLEAR in the table on page 1-6. | $\begin{aligned} & 1,3, \\ & 6,12 \end{aligned}$ |

## To use a menu function:

1. Press a menu key (shifted) to produce a menu in the display - a series of choices.
2. Press $\rightarrow \longleftarrow \square \downarrow$ to move the underline to the item you want to select.
3. Press ENTER while the item is underlined.

With numbered menu items, you can either press ENTER while the item is underlined, or just enter the number of the item.

The CONST and SUMS menu keys have more menu pages, turning on the (or $\Rightarrow$ ) annunciator. You can use the cursor keys or press the menu key once to access the next menu page.

The following example shows you how to use a menu function:

## Example:

$6 \div 7=0.8571428571 \ldots$

| Keys: | Display: |
| :---: | :---: |
| 6 ENTER $7 \times$ DISPLAY | 1FIX 2 SCI |
|  | 3EPG $\quad 4 \mathrm{PLL}$ |
| 4. (\{PLL \}) | 8.5714285714E-1 |
| ( or $\downarrow \rightarrow$ ENTER) |  |

Menus help you execute dozens of functions by guiding you to them with menu choices. You don't have to remember the names of the functions built into the calculator nor search through the names printed on its keyboard.

## Exiting Menus

Whenever you execute a menu function, the menu automatically disappears, as in the above example. If you want to leave a menu without executing a function, you have three options:

- Pressing $\leftrightarrows$ backs out of the 2-level CLEAR or MEM menu, one level at a time. Refer to [⿴囗 CLEAR in the table on page 1-6.
- Pressing $\leftrightarrows$ or cancels any other menu.

Keys:
123.5678

DISPLAY
123.5678

1 FIX 28 CI
3ENE 4PLL
Display:
123.5678

- Pressing another menu key replaces the old menu with the new one.

## Keys:

1 FIX 28 CI
3EHG 4FLL
1X 2VRRS
3ALL 48
123.5678

## RPN and ALG Keys

The calculator can be set to perform arithmetic operations in either RPN (Reverse Polish Notation) or ALG (Algebraic) mode.

In Reverse Polish Notation (RPN) mode, the intermediate results of calculations are stored automatically; hence, you do not have to use parentheses.

In algebraic (ALG) mode, you perform addition, subtraction, multiplication, and division in the traditional way.

## To select RPN mode:

Press RPN to set the calculator to RPN mode. When the calculator is in RPN mode, the RPN annunciator is on.

## To select ALG mode:

Press ALG to set the calculator to ALG mode. When the calculator is in ALG mode, the ALG annunciator is on.

## Example:

Suppose you want to calculate $1+2=3$.
In RPN mode, you enter the first number, press the ENTER key, enter the second number, and finally press the arithmetic operator key: $\pm$.

In ALG mode, you enter the first number, press $\pm$, enter the second number, and finally press the ENTER key.

| RPN mode | ALG mode |
| :---: | :---: |
| 1 ENTER $2+\square$ | $1+2$ ENTER |

In ALG mode, the results and the calculations are displayed. In RPN mode, only the results are displayed, not the calculations.

Note You can choose either ALG (Algebraic) or RPN (Reverse Polish Notation) mode for your calculations. Throughout the manual, the " $\checkmark$ " in the margin indicates that the examples or keystrokes in RPN mode must be performed differently in ALG mode. Appendix C explains how to use your calculator in ALG mode.

## The Display and Annunciators

## Annunciators

The display comprises two lines and annunciators.
The first line can display up to 255 characters. Entries with more than 14 characters will scroll to the left. However, if entries are more than 255 characters, the characters from the 256th onward are replaced with an ellipsis ( $\cdot \cdot \cdot$ ).

During inputting, the second line displays an entry; after calculating, it displays the result of a calculation. Every calculation is displayed in up to 14 digits, including an $E$ sign (exponent), and exponent value up to three digits.

The symbols on the display, shown in the above figure, are called annunciators. Each one has a special significance when it appears in the display.

HP 33s Annunciators

| Annunciator | Meaning | Chapter |
| :---: | :---: | :---: |
| B | The "B (Busy)" annunciator blinks while an operation, equation, or program is executing. |  |
| - | When in Fraction-display mode (press 5 | 5 |
| V | FDISP), only one of the " $\mathbf{\Delta}$ " or " $\mathbf{\nabla}$ " halves of the " $\mathbf{\Delta}$ V" annunciator will be turned on to indicate whether the displayed numerator is slightly less than or slightly greater than its true value. If neither part of " $\boldsymbol{\Delta} \boldsymbol{\nabla}$ " is on, the exact value of the fraction is being displayed. |  |
| 6 | Left shift is active. | 1 |
| E | Right shift is active. | 1 |
| RPN | Reverse Polish Notation mode is active. | 1, 2 |
| ALG | Algebraic mode is active. | 1, C |
| PRGM | Program-entry is active. | 12 |
| EQN | Equation-entry mode is active, or the calculator is evaluating an expression or executing an equation. | 6 |
| 01234 | Indicates which flags are set (flags 5 through 11 have no annunciator. | 13 |
| RAD or GRAD | Radians or Grad angular mode is set. DEG mode (default) has no annunciator. | 4 |
| HEX OCT BIN | Indicates the active number base. DEC (base 10, default) has no annunciator. | 10 |

HP 33s Annunciators (continued)

## Keying in Numbers

You can key in a number that has up to 12 digits plus a 3-digit exponent up to $\pm 499$. If you try to key in a number larger than this, digit entry halts and the $\mathbf{A}$ annunciator briefly appears.
If you make a mistake while keying in a number, press $\square$ to backspace and delete the last digit, or press $[\mathbf{C}$ to clear the whole number.

## Making Numbers Negative

The t/- key changes the sign of a number.

- To key in a negative number, type the number, then press + +
- To change the sign of a number that was entered previously, just press + + (If the number has an exponent, +4 affects only the mantissa - the non-exponent part of the number.)

## Exponents of Ten

## Exponents in the Display

Numbers with exponents of ten (such as $4.2 \times 10^{-5}$ ) are displayed with an E preceding the exponent (such as $4,2000 \mathrm{E}-5$ ).

A number whose magnitude is too large or too small for the display format will automatically be displayed in exponential form.

For example, in FIX 4 format for four decimal places, observe the effect of the following keystrokes:

## Keys:

| .000062 | $0.000062_{2}$ |
| :--- | :--- |
| [ENTER] | 0.0001 |
|  |  |
| .000042 ENTER | $4.20006-5$ |

## Description:

Shows number being entered.
Rounds number to fit the display format.
Automatically uses scientific notation because otherwise no significant digits would appear.

## Keying in Exponents of Ten

Use [E] (exponent) to key in numbers multiplied by powers of ten. For example, take Planck's constant, $6.6261 \times 10^{-34}$ :

1. Key in the mantissa (the non-exponent part) of the number. If the mantissa is negative, press ty after keying in its digits.

## Keys: Display:

6.6261 6.6261_
2. Press $E$. Notice that the cursor moves behind the $E$ :

E] 6.6261E
3. Key in the exponent. (The largest possible exponent is $\pm 499$.) If the exponent is negative, press after you key in the E or after you key in the value of the exponent:

34 + $6.6261 \mathrm{E}-34$

For a power of ten without a multiplier, such as $10^{34}$, just press $E$ ] 34 . The calculator displays 1 E 34 .

## Other Exponent Functions

To calculate an exponent of ten (the base 10 antilogarithm), use $10^{x}$. To calculate the result of any number raised to a power (exponentiation), use $\boldsymbol{y x}^{x}$ (see chapter 4).

## Understanding Digit Entry

As you key in a number, the cursor (_) appears in the display. The cursor shows you where the next digit will go; it therefore indicates that the number is not complete.

| Keys: | Display: | Description: |
| :---: | :---: | :--- |
| 123 | $123_{-}$ | Digit entry not terminated: the number <br>  |

If you execute a function to calculate a result, the cursor disappears because the number is complete - digit entry has been terminated.
$\sqrt{x} \quad 11$. $0905 \quad$ Digit entry is terminated.

Pressing ENTER terminates digit entry. To separate two numbers, key in the first number, press ENTER to terminate digit, entry, and then key in the second number

| 123 ENTER | 123.0000 | A completed number. |
| :--- | :--- | :--- |
| $4 \pm$ | 127.0000 | Another completed number. |

If digit entry is not terminated (if the cursor is present), $\square$ backspaces to erase the last digit. If digit entry is terminated (no cursor), $\square$ acts like $\square$ and clears the entire number. Try it!

## Range of Numbers and OVERFLOW

The smallest number available on the calculator is $1 \times 10^{-499}$. The largest number is $9.99999999999 \times 10^{499}$ (displayed as 1 , 00006500 because of rounding).

- If a calculation produces a result that exceeds the largest possible number, $9.99999999999 \times 10499$ is returned, and the warning message OVERFLOW appears.
- If a calculation produces a result smaller that the smallest possible number, zero is returned. No warning message appears.

## Doing Arithmetic

All operands (numbers) must be present before you press a function key. (When you press a function key, the calculator immediately executes the function shown on that key.)

All calculations can be simplified into one-number functions and/or two-number functions.

## One-Number Functions

To use a one-number function (such as $1 / x, \sqrt{x}, x^{2}, \square \sqrt[3]{x}, \square x^{3}, \square$ INTG, $x$, $x$, \% or $+/$

1. Key in the number. ( You don't need to press ENTER.)
2. Press the function key. (For a shifted function, press the appropriate $\square$ $\rightarrow$ shift key first.)

For example, calculate $1 / 32$ and $\sqrt{148.84}$. Then square the last result and change its sign.

## Keys: Display: Description:

32
$1 / x$
$148.84 \sqrt{x}$
$x^{2}$
+/-

32
0.0 .313
12.2060
148.8406
$-148.8406$

Operand.
Reciprocal of 32.
Square root of 148.84 .
Square of 12.2.
Negation of 148.8400 .

The one-number functions also include trigonometric, logarithmic, hyperbolic, and parts-of-numbers functions, all of which are discussed in chapter 4.

## Two-Number Functions

In RPN mode, to use a two-number function (such as $\square, \square, \square, \square, \square, y^{x}$,

1. Key in the first number.
2. Press ENTER to separate the first number from the second.
3. Key in the second number. (Do not press ENTER.)
4. Press the function key. (For a shifted function, press the appropriate shift key first.)
[^0]For example,

| To calculate: | Press: | Display: |
| :---: | :---: | :---: |
| $12+3$ | 12 ENTER 3 + | 15.0000 |
| 12-3 | 12 ENTER 3 - | 9.0000 |
| $12 \times 3$ | 12 ENTER $3 \times$ | 36.0000 |
| $12^{3}$ | 12 ENTER 3 碞 | 1,728.0060 |
| Percent change from | 8 ENTER 5 \% ${ }^{\text {a }}$ | -37.5006 |
| 8 to 5 |  |  |

The order of entry is important only for non-commutative functions such as $\square$,
 \%CHG. If you type numbers in the wrong order, you can still get the correct answer (without re-typing them) by pressing $x \triangleleft y$ to swap the order of the numbers on the stack. Then press the intended function key. (This is explained in detail in chapter 2 under "Exchanging the X - and Y -Registers in the Stack.")

## Controlling the Display Format

## Periods and Commas in Numbers

To exchange the periods and commas used for the decimal point (radix mark) and digit separators in a number:

1. Press MODES to display the MODES menu.
2. Specify the decimal point (radix mark) by pressing $\{\cdot\}$ or $\left\{{ }^{\prime}\right\}$.

For example, the number one million looks like:

- $1,000,000$, 0006 if you press $\{\cdot\}$ or
- 1, 000, 000, 0000 if you press $\{$ \} $\}$.

## Number of Decimal Places

All numbers are stored with 12-digit precision, but you can select the number of decimal places to be displayed by pressing DISPLAY (the display menu). During some complicated internal calculations, the calculator uses 15 -digit precision for intermediate results. The displayed number is rounded according to the display format. The DISPLAY menu gives you four options:

Fix SCI EHE fLL

## Fixed-Decimal Format (\{F IX\})

FIX format displays a number with up to 11 decimal places ( 11 digits to the right of the " r " or " s " radix mark) if they fit. After the prompt $\mathrm{FIX}_{-}$, type in the number of decimal places to be displayed. For 10 or 11 places, press $\cdot 0$ or $\square$.

For example, in the number $123,456 \cdot 7089$, the " 7 ", " 0 ", " 8 ", and " 9 " are the decimal digits you see when the calculator is set to FIX 4 display mode.

Any number that is too large or too small to display in the current decimal-place setting will automatically be displayed in scientific format.

## Scientific Format (\{SCI $\}$ )

SCl format displays a number in scientific notation (one digit before the " " " or " $\mathrm{\prime}$ " radix mark) with up to 11 decimal places (if they fit) and up to three digits in the exponent. After the prompt, $\mathrm{SCI}_{\mathbf{C}}$, type in the number of decimal places to be displayed. For 10 or 11 places, press $\cdot 0$ or $\bullet$. (The mantissa part of the number will always be less than 10.)

For example, in the number 1.2346E5, the "2", "3", "4", and "6" are the decimal digits you see when the calculator is set to SCl 4 display mode. The " 5 " following the " E " is the exponent of 10: $1.2346 \times 10^{5}$.

## Engineering Format (\{ENG\})

ENG format displays a number in a manner similar to scientific notation, except that the exponent is a multiple of three (there can be up to three digits before the " $\cdot$ " or " $\stackrel{\text { " radix mark). This format is most useful for scientific and engineering }}{ }$ calculations that use units specified in multiples of $10^{3}$ (such as micro-, milli-, and kilo-units.)

After the prompt, $\mathrm{ENG} \mathrm{G}_{-}$, type in the number of digits you want after the first significant digit. For 10 or 11 places, press $\cdot 0$ or $\square 1$.

For example, in the number 123.46 E 3 , the " 2 ", " 3 ", "4", and " 6 " are the significant digits after the first significant digit you see when the calculator is set to ENG 4 display mode. The " 3 " following the " E " is the (multiple of 3 ) exponent of 10: $123.46 \times 10^{3}$.

Pressing ENG or $\rightarrow$ ENG will cause the exponent display for the number being displayed to change in multiples of 3 .

For example, key in the number 12.346 E 4 and pressing ENG will convert the displayed value to $123 \cdot 46 E 3$, which the mantissa $n$ satisfies $1 \leq n<1000$ and the exponent is a multiple of 3 . When you press ENG again, the displayed value is converted to $123,460 \mathrm{ED}$ by shifting the decimal point three places to the right and converting the exponent to the next lower multiple of 3 .

Key in the number 12.346 E 4 and pressing $\square$ ENG will convert the displayed value to $0.12346 E 6$, which the mantissa $n$ satisfies $0.01 \leq n<10$ and the exponent is a multiple of 3 . When you press $\square \boxed{\square N G}$ again, the displayed value is converted to $0.0012346 E 9$ by shifting the decimal point three places to the left and converting the exponent to the next higher multiple of 3 .

## ALL Format (\{fLL\})

ALL format displays a number as precisely as possible ( 12 digits maximum). If all the digits don't fit in the display, the number is automatically displayed in scientific format.

## SHOWing Full 12-Digit Precision

Changing the number of displayed decimal places affects what you see, but it does not affect the internal representation of numbers. Any number stored internally always has 12 digits.

For example, in the number 14.8745632019, you see only " 14.8746 " when the display mode is set to FIX 4, but the last six digits ("632019") are present internally in the calculator.

To temporarily display a number in full precision, press SHOW. This shows you the mantissa (but no exponent) of the number for as long as you hold down SHOW.

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| DISPLAY \{FIX\} 4 |  | Displays four decimal places. |
| 45 ENTER 1.3 区 | 58.5000 | Four decimal places displayed. |
| DISPLAY \{SCI 2 | 5.85 El | Scientific format: two decimal places and an exponent. |
| DISPLAY \{ENG $\}$ | 58.5E0 | Engineering format. |
| DISPLAY \{PLL\} | 58.5 | All significant digits; trailing zeros dropped. |
| DISPLAY $\{$ FIX $\}$ | 58.5000 | Four decimal places, no exponent. |
| 1/x | 0.0171 | Reciprocal of 58.5. |
| S SHOW (hold) | 170940170946 | Shows full precision until you release SHOW |

## Fractions

The HP 33s allows you to type in and display fractions, and to perform math operations on them. Fractions are real numbers of the form

$$
a b / c
$$

where $a, b$, and $c$ are integers; $0 \leq b<c$; and the denominator (c) must be in the range 2 through 4095.

## Entering Fractions

Fractions can be entered onto the stack at any time:

1. Key in the integer part of the number and press $\cdot \square$. (The first $\cdot$ separates the integer part of the number from its fractional part.)
2. Key in the fraction numerator and press $\cdot \square$ again. The second $\cdot$ separates the numerator from the denominator.
3. Key in the denominator, then press ENTER or a function key to terminate digit entry. The number or result is formatted according to the current display format.

The $a b / c$ symbol under the $\cdot \square$ key is a reminder that the $\square$ key is used twice for fraction entry.
For example, to enter the fractional number $123 / 8$, press these keys:

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| 12 | 12 | Enters the integer part of the number. |
| $\square$ | 12. | The key is interpreted in the normal manner. |
| 3 | 12.3_ | Enters the numerator of the fraction (the number is still displayed in decimal form). |
| $\square$ | $123 \%$ | The calculator interprets the second $\cdot \square$ as a fraction and separates the numerator from denominator. |
| 8 | $123 \% 8$ | Appends the denominator of the fraction. |
| ENTER | 12.3750 | Terminates digit entry; displays the number in the current display format. |

| Keys: | Display: | Description: |
| :--- | :--- | :--- |
| 0.08 | $0.3 / 8_{-}$ | Enters no integer part. (3 <br> also works.) |
| ENTER | 0.3750 | lerminates digit entry; displays the <br> number in the current display format <br> (FIX 4). |

## Displaying Fractions

Press $\square$ FDISP to switch between Fraction-display mode and the current decimal display mode.

Keys:
Display:
Description:

| $2 \square 3 \bullet$ | $23 / 8$ | Dis |
| :---: | :---: | :---: |
| ENTER | 12.3750 | Terminates digit entry; displays the number in the current display format. |
| (⿴囗 FIISP | $123 / 8$ | Displays the number |

Now add $3 / 4$ to the number in the X-register ( $123 / 8$ ):
Keys: Display: Description:

| - 3 | $0.3 / 4$ | Displays characters as you key them in. |
| :---: | :---: | :---: |
| $\pm$ | $131 / 8$ | Adds the numbers in the X - and |
|  |  | Y-registers; displays the result as a fraction. |
| (6) FDISP | 13.1250 | Switches to current decimal display |
|  |  | format. |

Refer to chapter 5, "Fractions," for more information about using fractions.

## Messages

The calculator responds to certain conditions or keystrokes by displaying a message. The symbol comes on to call your attention to the message.

- To clear a message, press $\mathbb{C}$ or $\leftarrow$.
- To clear a message and perform another function, press any other key.

If no message appears but $\boldsymbol{\Delta}$ does, you have pressed an inactive key (a key that has no meaning in the current situation, such as 3 in Binary mode).

All displayed messages are explained in appendix F, "Messages".

## Calculator Memory

The HP 33s has 31 KB of memory in which you can store any combination of data (variables, equations, or program lines).

## Checking Available Memory

Pressing MEM displays the following menu:
1UAR EPCM
31,277
Where
31,277 is the number of bytes of memory available.
Pressing the $\{$ VRR $\}$ menu key displays the catalog of variables (see "Reviewing Variables in the VAR Catalog" in chapter 3). Pressing the \{PGM\} menu key displays the catalog of programs.

1. To enter the catalog of variables, press $\{$ UAR $\} ;$ to enter the catalog of programs, press \{PGM\}.
2. To review the catalogs, press $\downarrow$ or $\uparrow$.
3. To delete a variable or a program, press (CLEAR while viewing it in its catalog.
4. To exit the catalog, press $C$.

## Clearing All of Memory

Clearing all of memory erases all numbers, equations, and programs you've stored. It does not affect mode and format settings. (To clear settings as well as data, see "Clearing Memory" in appendix B.)

## To clear all of memory:

1. Press $⿴ 囗 \rightarrow$ CLEAR $\{\mathrm{HLL}\}$. You will then see the confirmation prompt CLR ALL ? $\{\mathrm{Y}\}\{\mathrm{H}\}$, which safeguards against the unintentional clearing of memory.
2. Press $\{\mathrm{Y}\}$ (yes).

## 2

## RPN: The Automatic Memory Stack

This chapter explains how calculations take place in the automatic memory stack in RPN mode. You do not need to read and understand this material to use the calculator, but understanding the material will greatly enhance your use of the calculator, especially when programming.

In part 2, "Programming", you will learn how the stack can help you to manipulate and organize data for programs.

## What the Stack Is

Automatic storage of intermediate results is the reason that the HP 33s easily processes complex calculations, and does so without parentheses. The key to automatic storage is the automatic, RPN memory stack.

HP's operating logic is based on an unambiguous, parentheses-free mathematical logic known as "Polish Notation," developed by the Polish logician Jan Łukasiewicz (1878-1956).

While conventional algebraic notation places the operators between the relevant numbers or variables, Łukasiewicz's notation places them before the numbers or variables. For optimal efficiency of the stack, we have modified that notation to specify the operators after the numbers. Hence the term Reverse Polish Notation, or RPN.

The stack consists of four storage locations, called registers, which are "stacked" on top of each other. These registers - labeled $X, Y, Z$, and $T$ - store and manipulate four current numbers. The "oldest" number is stored in the T- (top) register. The stack is the work area for calculations.

The most＂recent＂number is in the X－register：this is the number you see in the second line of the display．

In programming，the stack is used to perform calculations，to temporarily store intermediate results，to pass stored data（variables）among programs and subroutines，to accept input，and to deliver output．

## The $X$ and $Y$－Registers are in the Display

The X and Y －Registers are what you see except when a menu，a message，or a program line is being displayed．You might have noticed that several function names include an $x$ or $y$ ．

This is no coincidence：these letters refer to the X －and Y －registers．For example， （G］ $10^{x}$ raises ten to the power of the number in the X －register．

## Clearing the X－Register

Pressing（GLEAR $\{\times\}$ always clears the X －register to zero；it is also used to program this instruction．The $C$ key，in contrast，is context－sensitive．It either clears or cancels the current display，depending on the situation：it acts like $⿴ 囗$ CLEAR $\{\times\}$ only when the $X$－register is displayed．$\leftrightarrows$ also acts like $⿴ 囗$ CLEAR $\{x\}$ when the $X$－register is displayed and digit entry is terminated（no cursor present）．It cancels other displays：menus，labeled numbers，messages，equation entry，and program entry．

## Reviewing the Stack

## $R \downarrow$ (Roll Down)

The R $\quad$ (roll down) key lets you review the entire contents of the stack by "rolling" the contents downward, one register at a time. You can see each number when it enters the X -register.

Suppose the stack is filled with 1, 2, 3, 4. (press 1 ENTER] 2 ENTER] 3 ENTER 4) Pressing $\mathbb{R} \downarrow$ four times rolls the numbers all the way around and back to where they started:

| T | 1 |  | 4 |  | 3 |  | 2 |  | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Z | 2 |  | 1 |  | 4 |  | 3 |  | 2 |
| Y | 3 |  | 2 |  | 1 |  | 4 |  | 3 |
| X | 4 | Rt | 3 | Rt | 2 | R | 1 | Rt | 4 |

What was in the X-register rotates into the T-register, the contents of the T-register rotate into the Z-register, etc. Notice that only the contents of the registers are rolled - the registers themselves maintain their positions, and only the X - and Y-register's contents are displayed.

## $\mathbf{R} \uparrow$ (Roll Up)

The $\mathbb{R}$ (roll up) key has a similar function to $R \downarrow$ except that it "rolls" the stack contents upward, one register at a time.

The contents of the X -register rotate into the Y -register; what was in the T -register rotates into the X -register, and so on.

| $\mathbf{T}$ | 1 |
| :--- | :--- |
|  | 1 |
| $\mathbf{Z}$ | 2 |
| $\mathbf{Y}$ | 3 |
|  | 4 |

|  | 1 |
| :---: | :---: |
|  | 2 |
|  | 3 |
| R 4 | 4 |

## Exchanging the X - and Y -Registers in the Stack

Another key that manipulates the stack contents is $x \not y$ ( $x$ exchange $y$ ). This key swaps the contents of the X - and Y -registers without affecting the rest of the stack. Pressing $x \neq y$ twice restores the original order of the X - and Y -register contents.

The x x y function is used primarily to swap the order of numbers in a calculation. For example, one way to calculate $9 \div(13 \times 8)$ :
Press 13 ENTER 8 x $9 x \not x+\square$.
The keystrokes to calculate this expression from left-to-right are:
9 ENTER 13 ENTER 8 区 $\dagger$.

Note
Always make sure that there are no more than four numbers in the stack at any given time - the contents of the T-register (the top register) will be lost whenever a fifth number is entered.

## Arithmetic - How the Stack Does It

The contents of the stack move up and down automatically as new numbers enter the X -register (lifting the stack) and as operators combine two numbers in the X and Y -registers to produce one new number in the X -register (dropping the stack).

Suppose the stack is filled with the numbers $1,2,3$ and 4 . See how the stack drops and lifts its contents while calculating

$$
3+4-9
$$

1. The stack "drops" its contents. The T-(top) register replicates its contents.
2. The stack "lifts" its contents. The T-register's contents are lost.
3. The stack drops.

- Notice that when the stack lifts, it replaces the contents of the T - (top) register with the contents of the Z-register, and that the former contents of the T-register are lost. You can see, therefore, that the stack's memory is limited to four numbers.
- Because of the automatic movements of the stack, you do not need to clear the X -register before doing a new calculation.
- Most functions prepare the stack to lift its contents when the next number enters the $X$-register. See appendix B for lists of functions that disable stack lift.

## How ENTER Works

You know that ENTER separates two numbers keyed in one after the other. In terms of the stack, how does it do this? Suppose the stack is again filled with 1, 2, 3 , and 4 . Now enter and add two new numbers:

1. Lifts the stack.
2. Lifts the stack and replicates the $X$-register.
3. Does not lift the stack.
4. Drops the stack and replicates the T-register.

ENTER replicates the contents of the X -register into the Y -register. The next number you key in (or recall) writes over the copy of the first number left in the X-register. The effect is simply to separate two sequentially entered numbers.

You can use the replicating effect of ENTER to clear the stack quickly: press 0 ENTER ENTER ENTER. All stack registers now contain zero. Note, however, that you don't need to clear the stack before doing calculations.

## Using a Number Twice in a Row

You can use the replicating feature of ENTER to other advantages．To add a number to itself，press ENTER + ．

## Filling the stack with a constant

The replicating effect of ENTER together with the replicating effect of stack drop （from Tinto Z）allows you to fill the stack with a numeric constant for calculations．

## Example：

Given bacterial culture with a constant growth rate of $50 \%$ per day，how large would a population of 100 be at the end of 3 days？

|  |  |  |  |  |  |  | ates | －reg |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | T | 1.5 |  | 1.5 |  | 1.5 |  | 1.5 |  | 1.5 |
| 1.5 | Z | 1.5 |  | 1.5 |  | 1.5 |  | 1.5 |  | 1.5 |
| ENTER | Y | 1.5 |  | 1.5 |  | 1.5 |  | 1.5 |  | 1.5 |
| ENTER | X | 1.5 | 100 | 100 | 区 | 150 | 区 | 225 | $\pm$ | 337.5 |
| 1 |  |  | 2 |  | 3 |  | 4 |  | 5 |  |

1．Fills the stack with the growth rate．
2．Keys in the initial population．
3．Calculates the population after 1 day．
4．Calculates the population after 2 days．
5．Calculates the population after 3 days．

## How CLEAR x Works

Clearing the X －register puts a zero in the X －register．The next number you key in （or recall）writes over this zero．

There are three ways to clear the contents of the X－register，that is，to clear $x$ ：
1．Press $C$
2．Press $\leftarrow$
3．Press $⿴ 囗$ CLEAR $\{\times\}$（Mainly used during program entry．）
Note these exceptions：

- During program entry, $\leftrightarrows$ deletes the currently-displayed program line and [C] cancels program entry.
- During digit entry, $\leftrightarrows$ backspaces over the displayed number.
- If the display shows a labeled number (such as $\mathrm{A}=\boldsymbol{2}$. 00604), pressing C or $\leftrightarrows$ cancels that display and shows the X -register.
- When viewing an equation, $\square$ displays the cursor at the end the equation to allow for editing.
- During equation entry, $\boxed{\text { backspaces over the displayed equation, one }}$ function at a time.

For example, if you intended to enter 1 and 3 but mistakenly entered 1 and 2 , this is what you should do to correct your error:

1. Lifts the stack
2. Lifts the stack and replicates the $X$-register.
3. Overwrites the X -register.
4. Clears $x$ by overwriting it with zero.
5. Overwrites $x$ (replaces the zero.)

## The LAST X Register

The LAST X register is a companion to the stack: it holds the number that was in the X -register before the last numeric function was executed. (A numeric function is an operation that produces a result from another number or numbers, such as $\sqrt{x}$.) Pressing [⿴囗 LASTx returns this value into the X -register.

This ability to retrieve the "last x " has two main uses:

1. Correcting errors.

## 2．Reusing a number in a calculation．

See appendix $B$ for a comprehensive list of the functions that save $x$ in the LAST $X$ register．

## Correcting Mistakes with LAST X

## Wrong One－Number Function

If you execute the wrong one－number function，use［ASTx to retrieve the number so you can execute the correct function．（Press $[\mathbf{C}$ first if you want to clear the incorrect result from the stack．）

Since \％and $\quad$ \％CHG don＇t cause the stack to drop，you can recover from these functions in the same manner as from one－number functions．

## Example：

Suppose that you had just computed $\ln 4.7839 \times\left(3.879 \times 10^{5}\right)$ and wanted to find its square root，but pressed $e^{x}$ by mistake．You don＇t have to start over！To find the correct result，press $⿴ 囗$ LASTx $\sqrt{x}$ ．

## Mistakes with Two－number Functions

If you make a mistake with a two－number operation，（ $\square, \square, \boxed{\square}, \square, \square_{\square} \boldsymbol{\square}$ ，
 you can correct it by using LASTx and the inverse of the two－number function．

1．Press［⿴囗 LAST $x$ to recover the second number（ $x$ just before the operation）．
2．Execute the inverse operation．This returns the number that was originally first． The second number is still in the LAST $X$ register．Then：
－If you had used the wrong function，press［ASTX again to restore the original stack contents．Now execute the correct function．
－If you had used the wrong second number，key in the correct one and execute the function．

If you had used the wrong first number，key in the correct first number，press $⿴ 囗$ LASTX to recover the second number，and execute the function again．（Press ［C first if you want to clear the incorrect result from the stack．）

## Example：

Suppose you made a mistake while calculating

$$
16 \times 19=304
$$

There are three kinds of mistakes you could have made：

## Wrong <br> Calculation：

| 16 ENTER $19 \square$ | Wrong function | （1）［AST ${ }^{\text {d }}$ |
| :---: | :---: | :---: |
|  |  | （4）LASTX 区 |
| 15 ENTER $19 \times$ | Wrong first number | 16 （LASTX 区 |
| 16 ENTER $18 \times$ | Wrong second num | （LAST $x$ ］ 19 |

## Reusing Numbers with LAST X

You can use LasTx to reuse a number（such as a constant）in a calculation． Remember to enter the constant second，just before executing the arithmetic operation，so that the constant is the last number in the X －register，and therefore can be saved and retrieved with［⿴囗 LASTX．

## Example：

$$
\text { Calculate } \frac{96.704+52.3947}{52.3947}
$$

|  | $t$ | 52.3947 | $t$ | $\pm$ | $t$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | z |  | z |  | $t$ |
| 96.704 | 96.7040 |  | 96.7040 |  | z |
| ENTER | 96.7040 |  | 52.3947 |  | 149.0987 |
| LAST | I |  | I | $\pm$ | 52.3947 |

|  | T | $t$ |
| :---: | :---: | :---: |
|  | Z | z |
|  | Y | 149.0987 |
| (6) LASTx | X | 52.3947 |

$\div$

| $t$ |
| :---: |
| $t$ |
| $z$ |
| 2.8457 |

LAST X 52.3947
52.3947

Keys:
96.704 ENTER
$52.3947+$
[四 LASTX
$\div$

Display:
96.7046
149.0987
52.3947
2.8457

Description:
Enters first number.
Intermediate result.
Brings back display from before $\pm$.
Final result.

## Example:

Two close stellar neighbors of Earth are Rigel Centaurus (4.3 light-years away) and Sirius ( 8.7 light-years away). Use $c$, the speed of light $\left(9.5 \times 10^{15}\right.$ meters per year) to convert the distances from the Earth to these stars into meters:

To Rigel Centaurus: $4.3 \mathrm{yr} \times\left(9.5 \times 10^{15} \mathrm{~m} / \mathrm{yr}\right)$.
To Sirius: $8.7 \mathrm{yr} \times\left(9.5 \times 10^{15} \mathrm{~m} / \mathrm{yr}\right)$.

Keys:
Display:
4.3000
4.3 ENTER

## Description:

Light-years to Rigel Centaurus.

| 9.5 E 15 | $9.5 E 15$ | Speed of light, $c$. |
| :--- | :--- | :--- |
| $x$ |  | 4.0850 E 16 |$\quad$ Meters to R. Centaurus.

## Chain Calculations in RPN mode

In RPN mode, the automatic lifting and dropping of the stack's contents let you retain intermediate results without storing or reentering them, and without using parentheses.

## Work from the Parentheses Out

For example, solve $(12+3) \times 7$.
If you were working out this problem on paper, you would first calculate the intermediate result of $(12+3) \ldots$

$$
(12+3)=15
$$

... then you would multiply the intermediate result by 7 :

$$
(15) \times 7=105
$$

Solve the problem in the same way on the HP 33s, starting inside the parentheses:
Keys:
Display:
Description:

12 ENTER $3+15$. 9060 Calculates the intermediate result first.
You don't need to press ENTER to save this intermediate result before proceeding; since it is a calculated result, it is saved automatically.

## Keys:

Display:
Description:
7 区
105. 0000 Pressing the function key produces the answer. This result can be used in further calculations.

Now study the following examples. Remember that you need to press ENTER only to separate sequentially-entered numbers, such as at the beginning of a problem The operations themselves ( $\pm, \square$, etc.) separate subsequent numbers and save intermediate results. The last result saved is the first one retrieved as needed to carry out the calculation.

Calculate $2 \div(3+10)$ :

## Keys: <br> Display: <br> Description:

| 3 ENTER $10 \pm$ | 13.0000 | Calculates ( $3+10$ ) first. |
| :---: | :---: | :---: |
| $2 \times x \sim y$ ¢ | 0.1538 | Puts 2 before 13 so the division is |

Calculate $4 \div[14+(7 \times 3)-2]$ :

## Keys:

Display:
21.0000
33.0000
33.9000
0.1212

## Description:

Calculates ( $7 \times 3$ ).
Calculates denominator.
Puts 4 before 33 in preparation for division.
Calculates $4 \div 33$, the answer.

Problems that have multiple parentheses can be solved in the same manner using the automatic storage of intermediate results. For example, to solve $(3+4) \times(5+$ 6 ) on paper, you would first calculate the quantity $(3+4)$. Then you would calculate $(5+6)$. Finally, you would multiply the two intermediate results to get the answer.

Work through the problem the same way with the HP 33s, except that you don't have to write down intermediate answers-the calculator remembers them for you.

## Keys: <br> Display: <br> Description:

3 ENTER $4+$
5 ENTER $6+$
区
7.0000
11.0000
77.0000

First adds $(3+4)$
Then adds ( $5+6$ )
Then multiplies the intermediate answers together for the final answer.

## Exercises

## Calculate：

$$
\frac{\sqrt{(16.3805 \times 5)}}{0.05}=181.0000
$$

## Solution：

16.3805 ENTER $5 \times \sqrt{x} .05 \div$

## Calculate：

$$
\sqrt{[(2+3) \times(4+5)]}+\sqrt{[(6+7) \times(8+9)]}=21.5743
$$

## Solution：

 －+

## Calculate：

$(10-5) \div[(17-12) \times 4]=0.2500$

## Solution：

```
17 ENTER 12 - 4 x 10 ENTER 5 - x x~y ! - 
```

or
10 ENTER 5 ■ 17 ENTER 12 - 4 区 $\dagger$

## Order of Calculation

We recommend solving chain calculations by working from the innermost parentheses outward．However，you can also choose to work problems in a left－to－right order．

For example，you have already calculated：

$$
4 \div[14+(7 \times 3)-2]
$$

by starting with the innermost parentheses $(7 \times 3)$ and working outward，just as you would with pencil and paper．The keystrokes were 7 ENTER $3 \times 14 \pm$

If you work the problem from left－to－right，press
4 ENTER 14 ENTER 7 ENTER 3 区 +2 团．

This method takes one additional keystroke. Notice that the first intermediate result is still the innermost parentheses $(7 \times 3)$. The advantage to working a problem left-to-right is that you don't have to use $x \propto y$ to reposition operands for nomcommutaiive functions ( $\square$ and $\dagger \div$ ).

However, the first method (starting with the innermost parentheses) is often preferred because:

- It takes fewer keystrokes.
- It requires fewer registers in the stack.

## Note

When using the left-to-right method, be sure that no more than four intermediate numbers (or results) will be needed at one time (the stack can hold no more than four numbers).

The above example, when solved left-to-right, needed all registers in the stack at one point:
Keys:
Display:
Description:

| 4 ENTER 14 ENTER | 14.0000 | Saves 4 and 14 as intermediate numbers in the stack. |
| :---: | :---: | :---: |
| 7 ENTER 3 | 3 | At this point the stack is full with numbers for this calculation. |
| 区 | 21.0000 | Intermediate result. |
| $\pm$ | 35.0060 | Intermediate result. |
| $2 \square$ | 33.0060 | Intermediate result. |
| $\div$ | 0.1212 | Final result. |

## More Exercises

Practice using RPN by working through the following problems:

## Calculate:

$(14+12) \times(18-12) \div(9-7)=78.0000$

## A Solution：

Calculate：
$23^{2}-(13 \times 9)+1 / 7=412.1429$

## A Solution：

$23 x^{2} 13$ ENTER 9 区 $\boldsymbol{\square} 7$［1／x］

## Calculate：

$\sqrt{(5.4 \times 0.8) \div\left(12.5-0.7^{3}\right)}=0.5961$

## Solution：

or
5.4 ENTER 8 区 12.5 ENTER 7 ENTER $3 \sqrt{y x} \square \div \sqrt{x}$

Calculate：
$\sqrt{\frac{8.33 \times(4-5.2) \div[(8.33-7.46) \times 0.32]}{4.3 \times(3.15-2.75)-(1.71 \times 2.01)}}=4.5728$

## A Solution：

4 ENTER 5.2 － 8.33 区（国 LASTx］ 7.46 － 0.32 区 $\ddagger 3.15$ ENTER
$2.75 \square 4.3$ 区 1.71 ENTER 2.01 区 $\square \div \sqrt{x}$

## Storing Data into Variables

The HP 33s has 31 KB of user memory: memory that you can use to store numbers, equations, and program lines. Numbers are stored in locations called variables, each named with a letter from $A$ through $Z$. (You can choose the letter to remind you of what is stored there, such as $B$ for bank balance and $C$ for the speed of light.)

1. Cursor prompts for variable.
2. Indicates letter keys are active.
3. Letter keys.

Each white letter is associated with a key and a unique variable. The letter keys are automatically active when needed. (The A..Z annunciator in the display confirms this.)

Note that the variables, $X, Y, Z$ and $T$ are different storage locations from the X -register, Y -register, Z -register, and T -register in the stack.

## Storing and Recalling Numbers

Numbers are stored into and recalled from lettered variables with the STO (store) and RCL (recal) functions.

## To store a copy of a displayed number (X-register) to a variable:

Press STOC letter-key.

## To recall a copy of a number from a variable to the display:

Press RCL letter-key.

## Example: Storing Numbers.

Store Avogadro's number (approximately $6.0221 \times 10^{23}$ ) in $A$.

Keys:
Display:
6.0221 E 23
sTo
STOF
6.0221 E 23
0. 0000

RCL
6.0221 E 23

Description:
Avogadro's number.
Prompts for variable.
Displays function as long as key is held down.
Stores a copy of Avogadro's number in $A$. This also terminates digit entry (no cursor present).
Clears the number in the display. Prompts for variable.
Copies Avogadro's number from A the display.

## Viewing a Variable without Recalling It

The VIEW function shows you the contents of a variable without putting that number in the X-register. The display is labeled for the variable, such as:
$\mathrm{H}=$
1234.5678
$\rightarrow$ VIEW is most often used in programming, but it is useful anytime you want to view a variable's value without affecting the contents of the stack.

To cancel the VIEW display, press $\leftarrow$ or $\mathbb{C}$ once.

## Reviewing Variables in the VAR Catalog

The MEM (memory) function provides information about memory:
1URR 2PGM
ппппппппй
where $n n, n n n$ is the number of bytes of available memory.
Pressing the $\{\cup \mathrm{PR}\}$ menu key displays the catalog of variables.
Pressing the $\{\mathrm{PCl}\}$ menu key displays the catalog of programs.
To review the values at any or all non-zero variables:

1. Press ( 5 MEM \{VAR\}.
2. Press $\downarrow$ or $\uparrow$ to move the list and display the desired variable. (Note the $\uparrow$ annunciators, indicating that the $\downarrow$ and $\uparrow$ keys are active. If Fraction-display mode is active, $\boldsymbol{\Delta} \boldsymbol{\nabla}$ does not indicate accuracy.)
To see all the significant digits of a number displayed in the \{VPR $\}$ catalog, press $\rightarrow$ SHOW. (If it is a binary number with more than 12 digits, use the $\longleftarrow$ and $\square$ keys to see the rest.)
3. To copy a displayed variable from the catalog to the $X$-register, press ENTER.
4. To clear a variable to zero, press CLEAR while it is displayed in the catalog.
5. Press $\mathbf{C}$ to cancel the catalog.

## Clearing Variables

Variables' values are retained by Continuous Memory until you replace them or clear them. Clearing a variable stores a zero there; a value of zero takes no memory.

## To clear a single variable:

Store zero in it: Press 0 STO variable.

## To clear selected variables:

1. Press $\square$ MEM $\{W \mathrm{R}\}$ \} and use $\downarrow$ or $\uparrow$ to display the variable.
2. Press CLEAR.
3. Press $C$ to cancel the catalog.

To clear all variables at once:
Press © CLEAR \{URRS\}.

## Arithmetic with Stored Variables

Storage arithmetic and recall arithmetic allow you to do calculations with a number stored in a variable without recalling the variable into the stack. A calculation uses one number from the $X$-register and one number from the specified variable.

## Storage Arithmetic

Storage arithmetic uses STO $+ \pm$, STO $-\square$, STO $x$, or STO $\div$ to do arithmetic in the variable itself and to store the result there. It uses the value in the X-register and does not affect the stack.

New value of variable $=$ Previous value of variable $\{+,-, \times, \div\} x$.
For example, suppose you want to reduce the value in $A(15)$ by the number in the X-register (3, displayed). Press STO A. Now A = 12, while 3 is still in the display.
A 15
A

Result: 15-3
that is, $A-x$

## Recall Arithmetic

Recall arithmetic uses $\mathrm{RCL} ~ \pm, \mathrm{RCL} \square, \mathrm{RCL} \quad x$, or $\mathrm{RCL} \div$ to do arithmetic in the $X$-register using a recalled number and to leave the result in the display. Only the X-register is affected.

New $x=$ Previous $x\{+,-, \times, \div\}$ Variable
For example, suppose you want to divide the number in the $X$-register (3, displayed) by the value in $A(12)$. Press RCL $\div$ A. Now $x=0.25$, while 12 is still in $A$. Recall arithmetic saves memory in programs: using RCL $\pm A$ (one instruction) uses half as much memory as RCL A, $\pm$ (two instructions).

## Example:

Suppose the variables $D, E$, and $F$ contain the values 1,2 , and 3 . Use storage arithmetic to add 1 to each of those variables.

Keys:

| 1 STO D | 1.0060 | Stores the assumed values into the |
| :---: | :---: | :---: |
| 2 STO E | 2.0606 |  |
| 3 STO F | 3.0460 |  |
| 1 STO $\pm$ D |  | Adds 1 to $D, E$, and $F$. |
| STO $\pm$ E STO |  |  |
| $\pm \mathrm{F}$ | 1.0006 |  |
| $\rightarrow$ VIEW D |  | Displays the current value of $D$. |
|  | 2.0606 |  |
| $\rightarrow$ VIEW E | E= |  |
|  | 3.0406 |  |
| P VIEW F | $F=$ |  |
|  | 4.0960 |  |
| $\leftarrow$ | 1.0060 | Clears the VIEW display; displays |
|  |  | X-register again. |

Suppose the variables $D, E$, and $F$ contain the values 2,3 , and 4 from the last example. Divide 3 by $D$, multiply it by $E$, and add $F$ to the result.
Keys:
Display:
Description:

| 3 RCL $\dagger$ D | 1.5000 | Calculates $3 \div D$. |
| :---: | :---: | :---: |
| RCL $x \mathrm{E}$ | 4.5000 | $3 \div D \times E$. |
| RCL $\pm \mathrm{F}$ | 8.5000 | $3 \div D \times E+F$. |

## Exchanging x with Any Variable

The $x>$ key allows you to exchange the contents of $x$ (the displayed $X$-register) with the contents of any variable. Executing this function does not affect the $\mathrm{Y}-\mathrm{Z}$-, or T -registers

## Example:

Keys:
12 STO A 3

Display:
12.0000

3

## Description:

Stores 12 in variable A.
Displays $x$.

## The Variable "i"

There is a 27 th variable that you can access directly - the variable $i$. The $\square$ key is labeled " i ", and it means $i$ whenever the $\mathbf{A} . . \mathbf{Z}$ annunciator is on. Although it stores numbers as other variables do, $i$ is special in that it can be used to refer to other variables, including the statistics registers, using the (i) function. This is a programming technique called indirect addressing that is covered under "Indirectly Addressing Variables and Labels" in chapter 13.

## 4

## Real-Number Functions

This chapter covers most of the calculator's functions that perform computations on real numbers, including some numeric functions used in programs (such as $A B S$, the absolute-value function):

- Exponential and logarithmic functions.
- Quotient and Remainder of Divisions.
- Power functions. ( $y^{x}$ and $\sqrt[x]{\bar{y}}$ )
- Trigonometric functions.
- Hyperbolic functions.
- Percentage functions.
- Physics constants
- Conversion functions for coordinates, angles, and units.
- Probability functions.
- Parts of numbers (number-altering functions).

Arithmetic functions and calculations were covered in chapters 1 and 2. Advanced numeric operations (root-finding, integrating, complex numbers, base conversions, and statistics) are described in later chapters.

## Exponential and Logarithmic Functions

Put the number in the display, then execute the function - there is no need to press ENTER.

| To Calculate: |  |
| :--- | :--- |
| Press: |  |
| Natural logarithm (base e) | $\boxed{1}$ |
| Common logarithm (base 10) | $\boxed{\square}$ LOG |
| Natural exponential | $e^{x}$ |
| Common exponential (antilogarithm) | $\boxed{\square} 10^{x}$ |

## Quotient and Remainder of Division

You can use $\boxed{\square}$ INT $\div$ and $\rightarrow$ Rmdr to produce either the quotient or remainder of division operations involving two integers.

1. Key in the first integer.
2. Press ENTER to separate the first number from the second.
3. Key in the second number. (Do not press ENTER.)
4. Press the function key.

## Example:

To display the quotient and remainder produced by $58 \div 9$
Keys:
Display:
Description:

## Power Functions

To calculate the square of a number $x$, key in $x$ and press $x^{2}$.
To calculate the square root of a number $x$, key in $x$ and press $\sqrt{x}$.
To calculate the cube of a number $x$, key in $x$ and press 5 x $x^{3}$.
To calculate the cube root of a number $x$, key in $x$ and press $\sqrt[3]{x}$.
To calculate a power $x$ of 10, key in $x$ and press $\boxed{\square} 10^{x}$.

In RPN mode，to calculate a number $y$ raised to a power $x$ ，key in $y$ ENTER $x$ ， then press $y x$ ．（For $y>0, x$ can be any number；for $y<0, x$ must be an odd integer；for $y=0, x$ must be positive．）

| To Calculate： | Press： | Result： |
| :---: | :---: | :---: |
| $15^{2}$ | $15 \times{ }^{2}$ | 225.0000 |
| $10^{6}$ | 6 团 $10^{x}$ | 1，000，000， 0000 |
| 54 | 5 ENTER $4{ }^{x}$ | 625.0000 |
| 2－1．4 |  | 0.3789 |
| $(-1.4)^{3}$ | 1.4 ＋边 ENTER 匈 $x^{3}$ | －2．7440 |
| $\sqrt{196}$ | $196 \sqrt{x}$ | 14．0000 |
| $\sqrt[3]{-125}$ | 125 ＋国 这 | －5．0000 |

In RPN mode，to calculate a root $x$ of a number $y$（the $x^{\text {th }}$ root of $y$ ），key in $y$ ENTER $x$ ，then press $x_{V \bar{V}}$ ．For $y<0$ ，$x$ must be an integer．

| To Calculate： | Press： | Result： |
| :---: | :---: | :---: |
| $\sqrt[4]{625}$ |  | 5.0060 |
| $-1.4 .4 .37893$ |  | 2．0006 |

## Trigonometry

## Entering $\pi$

Press $\pi$ to place the first 12 digits of $\pi$ into the X －register．
（The number displayed depends on the display format．）Because $\pi$ is a function，it doesn＇t need to be separated from another number by ENTER．

Note that the calculator cannot exactly represent $\pi$ ，since $\pi$ is an irrational number．

## Setting the Angular Mode

The angular mode specifies which unit of measure to assume for angles used in trigonometric functions. The mode does not convert numbers already present (see "Conversion Functions" later in this chapter).

360 degrees $=2 \pi$ radians $=400$ grads
To set an angular mode, press MODES. A menu will be displayed from which you can select an option.

| Option | Description | Annunciator |
| :--- | :--- | :---: |
| $\{D E G\}$ | Sets Degrees mode (DEG). Uses decimal <br> degrees, not degrees, minutes, and <br> seconds. | none |
| $\{R A D\}$ | Sets Radians mode (RAD). <br> $\{G R A D\}$ | Sets Grads mode (GRAD). |

## Trigonometric Functions

With $x$ in the display:

| To Calculate: | Press: |
| :--- | :--- |
| Sine of $x$. | SIN |
| Cosine of $x$. | COS |
| Tangent of $x$. | TAN |
| Arc sine of $x$. | (国 ASIN |
| Arc cosine of $x$. | ACOS |
| Arc tangent of $x$. | ACO ATAN |

Note
Calculations with the irrational number $\pi$ cannot be expressed exactly by the 12-digit internal precision of the calculator. This is particularly noticeable in trigonometry. For example, the calculated $\sin \pi$ (radians) is not zero but $-2.0676 \times 10^{-13}$, a very small number close to zero.

## Example:

Show that cosine (5/7) $\pi$ radians and cosine $128.57^{\circ}$ are equal (to four significant digits).

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| MODES \{R PD \} |  | Sets Radians mode; RAD annunciator on. |
| - 57 E ENTER | 0.7143 | 5/7 in decimal format. |
| - $\square \pi \times$ COS | -0.6235 | $\operatorname{Cos}(5 / 7) \pi$. |
| MODES \{DEG\} | -0.6235 | Switches to Degrees mode (no annunciator). |
| 128.57 COS | -0.6235 | Calculates $\cos 128.57^{\circ}$, which is the same as $\cos (5 / 7) \pi$. |

## Programming Note:

Equations using inverse trigonometric functions to determine an angle $\theta$, often look something like this:

$$
\theta=\arctan (y / x) .
$$

If $x=0$, then $y / x$ is undefined, resulting in the error: $\operatorname{DIVIDEBYG}$. For a program, then, it would be more reliable to determine $\theta$ by a rectangular to polar conversion, which converts $(x, y)$ to $(r, \theta)$. See "Coordinate Conversions" later in this chapter.

## Hyperbolic Functions

With $x$ in the display:

| To Calculate: | Press: |
| :---: | :---: |
| Hyperbolic sine of $x$ (SINH). | (T) SIN |
| Hyperbolic cosine of $x$ (COSH). | (G) COS |
| Hyperbolic tangent of $x$ (TANH). | (4) TAN |
| Hyperbolic arc sine of $x$ (ASINH). | (G) HYP ASIN |
| Hyperbolic arc cosine of $x$ (ACOSH). | ( HYP A ACOS |
| Hyperbolic arc tangent of $x$ (ATANH). | (6) HYP ATATAN |

## Percentage Functions

The percentage functions are special (compared with $x$ and $\div$ ) because they preserve the value of the base number (in the $Y$-register) when they return the result of the percentage calculation (in the X -register). You can then carry out subsequent calculations using both the base number and the result without reentering the base number.

| To Calculate: | Press: |
| :--- | :--- |
| $x \%$ of $y$ | $y$ ENTER $x$ \% $\%$ |
| Percentage change from $y$ to $x .(y \neq 0)$ | $y$ ENTER $x$ \%CHG |

## Example:

Find the sales tax at $6 \%$ and the total cost of a $\$ 15.76$ item.
Use FIX 2 display format so the costs are rounded appropriately.

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| DISPLAY $\{\mathrm{FIX}\} 2$ |  | Rounds display to two decimal places. |
| 15.76 ENTER | 15.76 |  |
| 6 \% | 0.95 | Calculates 6\% tax. |

Suppose that the $\$ 15.76$ item cost $\$ 16.12$ last year. What is the percentage change from last year's price to this year's?

Keys:
16.12 ENTER
$15.76 \boldsymbol{\square} \boldsymbol{\square}$
DISPLAY $\{$ FIX $\}$

Display:
16.12
-2.23 This year's price dropped about
$-2.2333$
2.2\% from last year's price.

Description:

Restores FIX 4 format.

## Note

 The order of the two numbers is important for the \%CHG function. The order affects whether the percentage change is considered positive or negative.
## Physics Constants

There are 40 physics constants in the CONST menu. You can press $\rightarrow$ CONST to view the following items.

## CONST Menu

| Items | Description | Value |
| :---: | :---: | :---: |
| \{c\} | Speed of light in vacuum | $299792458 \mathrm{~m} \mathrm{~s}^{-1}$ |
| $\{\underline{ }\}$ | Standard acceleration of gravity | $9.80665 \mathrm{~m} \mathrm{~s}^{-2}$ |
| \{ $\left.{ }_{\text {c }}\right\}$ | Newtonian constant of gravitation | $6.673 \times 10^{-11} \mathrm{~m}^{3} \mathrm{~kg}^{-1} \mathrm{~s}^{-2}$ |
| \{ $\mathrm{Vmm}^{\text {b }}$ | Molar volume of ideal gas | $0.022413996 \mathrm{~m}^{3} \mathrm{~mol}^{-1}$ |
| \{ N H \} $\}$ | Avogadro constant | $6.02214199 \times 10^{23} \mathrm{~mol}^{-1}$ |
| $\{\mathrm{R} \infty$ \} | Rydberg constant | $10973731.5685 \mathrm{~m}^{-1}$ |
| \{e\} | Elementary charge | $1.602176462 \times 10^{-19} \mathrm{C}$ |
| \{me\} | Electron mass | $9.10938188 \times 10^{-31} \mathrm{~kg}$ |
| \{mP\} | Proton mass | $1.67262158 \times 10^{-27} \mathrm{~kg}$ |
| \{min\} | Neutron mass | $1.67492716 \times 10^{-27} \mathrm{~kg}$ |
| \{mer\} | Muon mass | $1.88353109 \times 10^{-28} \mathrm{~kg}$ |
| \{k\} | Boltzmann constant | $1.3806503 \times 10^{-23} \mathrm{~J} \mathrm{~K}^{-1}$ |
| \{ h$\}$ | Planck constant | $6.62606876 \times 10^{-34} \mathrm{~J} \mathrm{~s}$ |
| \{ $\overline{\mathrm{h}}$ \} | Planck constant over 2 pi | $1.054571596 \times 10^{-34} \mathrm{~J} \mathrm{~s}$ |
| \{\%0, $\}$ | Magnetic flux quantum | $2.067833636 \times 10^{-15} \mathrm{~Wb}$ |
| \{قo\} | Bohr radius | $5.291772083 \times 10^{-11 \mathrm{~m}}$ |
| \{ 80$\}$ | Electric constant | $8.854187817 \times 10^{-12} \mathrm{~F} \mathrm{~m}^{-1}$ |
| $\{\mathbb{R}\}$ | Molar gas constant | $8.314472 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{k}^{-1}$ |
| \{F\} | Faraday constant | $96485.3415 \mathrm{C} \mathrm{mol}^{-1}$ |
| \{ $\boldsymbol{H}\}$ | Atomic mass constant | $1.66053873 \times 10^{-27} \mathrm{~kg}$ |
| $\left\{H_{0}\right\}$ | Magnetic constant | $1.2566370614 \times 10^{-6} \mathrm{NA}^{-2}$ |
| $\{\mathrm{HE}\}$ | Bohr magneton | $9.27400899 \times 10^{-24} \mathrm{~J} \mathrm{~T}^{-1}$ |
| \{ $\boldsymbol{H} \boldsymbol{\prime}$ \} $\}$ | Nuclear magneton | $5.05078317 \times 10^{-27} \mathrm{~J} \mathrm{~T}^{-1}$ |
| \{ H F$\}$ | Proton magnetic moment | $1.410606633 \times 10^{-26} \mathrm{~J} \mathrm{~T}^{-1}$ |
| \{ He \} | Electron magnetic moment | $-9.28476362 \times 10^{-24} \mathrm{~J} \mathrm{~T}^{-1}$ |
| \{uri\} | Neutron magnetic moment | $-9.662364 \times 10^{-27} \mathrm{~J} \mathrm{~T}^{-1}$ |
| \{ $\mathrm{H} \mu \mathrm{H}\}$ | Muon magnetic moment | $-4.49044813 \times 10^{-26} \mathrm{~J} \mathrm{~T}^{-1}$ |

| Items | Description | Value |
| :---: | :---: | :---: |
| $\begin{aligned} & \{r-e\} \\ & \left\{\mathrm{Z}_{0}\right\} \end{aligned}$ | Classical electron radius Characteristic impendence of vacuum | $\begin{array}{r} 2.817940285 \times 10^{-15} \mathrm{~m} \\ 376.730313461 \Omega \end{array}$ |
| $\{\lambda \mathrm{C}\}$ | Compton wavelength | $2.426310215 \times 10^{-12} \mathrm{~m}$ |
| $\{\lambda \bar{\square} \mathrm{C}\}$ | Neutron Compton wavelength | $1.319590898 \times 10^{-15} \mathrm{~m}$ |
| $\{\lambda \subset \mathrm{F}\}$ | Proton Compton wavelength | $1.321409847 \times 10^{-15} \mathrm{~m}$ |
| $\{\alpha\}$ | Fine structure constant | $7.297352533 \times 10^{-3}$ |

| $\{\gamma \mathrm{P}\}$ | Proton gyromagnetic ratio | $267522212 \mathrm{~s}^{-1} \mathrm{~T}^{-1}$ |
| \{ C 1$\}$ | First radiation constant | $374177107 \times 10^{-16} \mathrm{Wm}^{2}$ |
| \{C2\} | Second radiation constant | 0.014387752 m K |
| \{0, 0 | Conductance quantum | $7.748091696 \times 10^{-5} \mathrm{~S}$ |
| Reference: Peter J.Mohr and Barry N.Taylor, CODATA Recommended Values of the Fundamental Physical Constants: 1998, Journal of Physical and Chemical Reference Data,Vol.28, No.6,1999 and Reviews of Modern Physics,Vol.72, No.2, 2000. |  |  |

## To insert a constant:

1. Position your cursor where you want the constant inserted.
2. Press CONST to display the physics constants menu.
3. Press $\rightarrow \longleftarrow \uparrow \square$ (or, you can press $\square$ CONST to access the next page, one page at a time) to scroll through the menu until the constant you want is underlined, then press ENTER to insert the constant.

## Conversion Functions

There are four types of conversions: coordinate (polar/rectangular), angular (degrees/radians), time (decimal/minutes-seconds), and unit (cm/in, ${ }^{\circ} \mathrm{C} /{ }^{\circ} \mathrm{F}, \mathrm{I} / \mathrm{gal}$, $\mathrm{kg} / \mathrm{lb})$.

## Coordinate Conversions

The function names for these conversions are $y, x \rightarrow \theta, r$ and $\theta, r \rightarrow y, x$.
Polar coordinates $(r, \theta)$ and rectangular coordinates $(x, y)$ are measured as shown in the illustration. The angle $\theta$ uses units set by the current angular mode. A calculated result for $\theta$ will be between $-180^{\circ}$ and $180^{\circ}$, between $-\pi$ and $\pi$ radians, or between -200 and 200 grads.

To convert between rectangular and polar coordinates:

1. Enter the coordinates (in rectangular or polar form) that you want to convert. In RPN mode, the order is $y$ ENTER $x$ or $\theta$ ENTER $r$.
2. Execute the conversion you want: press $⿴ \rightarrow \theta, r$ (rectangular-to-polar) or $\rightarrow \square$ (polar-to-rectangular). The converted coordinates occupy the $X$ and $Y$-registers.
3. The resulting display (the X -register) shows either $r$ (polar result) or $x$ (rectangular result). Press $x<y$ to see $\theta$ or $y$.

4-10 Real-Number Functions

## Example: Polar to Rectangular Conversion.

In the following right triangles, find sides $x$ and $y$ in the triangle on the left, and hypotenuse $r$ and angle $\theta$ in the triangle on the right.

## Example: Conversion with Vectors.

Engineer P.C. Bord has determined that in the RC circuit shown, the total impedance is 77.8 ohms and voltage lags current by $36.5^{\circ}$. What are the values of resistance $R$ and capacitive reactance $X_{C}$ in the circuit?

Use a vector diagram as shown, with impedance equal to the polar magnitude, $r$, and voltage lag equal to the angle, $\theta$, in degrees. When the values are converted to rectangular coordinates, the $x$-value yields $R$, in ohms; the $y$-value yields $X_{C}$, in ohms.

Keys:
MODES \{DEG\}

| $36.5+2$ ENTER | -36.5000 |
| :--- | :--- |
| 77.8 | 77.8 |
| $\rightarrow \rightarrow y, x$ | 62.5401 |
| $\rightarrow x \rightarrow y$ | -46.2772 |

Description:
Sets Degrees mode.
Enters $\theta$, degrees of voltage lag.
Enters $r$, ohms of total impedance.
Calculates $x$, ohms resistance, $R$.
Displays $y$, ohms reactance, $X_{C}$.

For more sophisticated operations with vectors (addition, subtraction, cross product, and dot product), refer to the "Vector Operations" program in chapter 15, "Mathematics Programs".

## Time Conversions

Values for time (in hours, H) or angles (in degrees, D) can be converted between a decimal-fraction form (H.h or D.d) and a minutes-seconds form (H.MMSSss or D.MMSSss) using the $\rightarrow \mathrm{HR}$ or $\rightarrow \mathrm{HMS}$ keys.

## To convert between decimal fractions and minutes-seconds:

1. Key in the time or angle (in decimal form or minutes-seconds form) that you want to convert.
2. Press $\rightarrow+\mathrm{HMS}$ or $\rightarrow \mathrm{HR}$. The result is displayed.

## Example: Converting Time Formats.

How many minutes and seconds are there in $1 / 7$ of an hour? Use FIX 6 display format.

Keys: Display: Description:
DISPLAY \{FIX\} 6
$\square 1 \square 7$
日 1/7_
Sets FIX 6 display format.
-

4-12 Real-Number Functions

## Angle Conversions

When converting to radians, the number in the $x$-register is assumed to be degrees; when converting to degrees, the number in the $x$-register is assumed to be radians.

## To convert an angle between degrees and radians:

1. Key in the angle (in decimal degrees or radians) that you want to convert.
2. Press $\rightarrow \rightarrow$ RAD or $\rightarrow$ DEG. The result is displayed.

## Unit Conversions

The HP 33s has eight unit-conversion functions on the keyboard: $\rightarrow \mathrm{kg}, \rightarrow \mathrm{lb}, \rightarrow^{\circ} \mathrm{C}$, $\rightarrow{ }^{\circ} \mathrm{F}, \rightarrow \mathrm{cm}, \rightarrow \mathrm{in}, \rightarrow \mathrm{l}, \rightarrow \mathrm{gal}$.

| To Convert: | To: | Press: | Displayed Results: |
| :---: | :---: | :---: | :---: |
| 1 lb | kg | $1 \rightarrow \square$ | 0.4536 (kilograms) |
| 1 kg | lb | $1 \rightarrow \rightarrow \mathrm{lb}$ | 2.2046 (pounds) |
| $32{ }^{\circ} \mathrm{F}$ | ${ }^{\circ} \mathrm{C}$ | $32 \rightarrow$ - $\rightarrow^{\circ} \mathrm{C}$ | 0. $\left.0600{ }^{\circ}{ }^{\circ} \mathrm{C}\right)$ |
| $100^{\circ} \mathrm{C}$ | ${ }^{\circ} \mathrm{F}$ | $100 \rightarrow \rightarrow{ }^{\circ} \mathrm{F}$ | 212.0006 ( ${ }^{\circ} \mathrm{F}$ ) |
| 1 in | cm | 1 - $\rightarrow \rightarrow \mathrm{cm}$ | 2.5400 (centimeters) |
| 100 cm | in | $100 \rightarrow \rightarrow$ in | 39.3761 (inches) |
| 1 gal | 1 | 1 - $\rightarrow$ 1 | 3.7854 (liters) |
| 11 | gal | $1 \rightarrow \rightarrow$ gal | 0.2642 (gallons) |

## Probability Functions

## Factorial

To calculate the factorial of a displayed non－negative integer $x(0 \leq x \leq 253)$ ，press ［⿴囗 $x$ ］（the left－shifted $[1 / x$ key）．

## Gamma

To calculate the gamma function of a noninteger $x, \Gamma(x)$ ，key in（ $x-1$ ）and press （国 $x$ ．The $x$ ！function calculates $\Gamma(x+1)$ ．The value for $x$ cannot be a negative integer．

## Probability

## Combinations

To calculate the number of possible sets of $n$ items taken $r$ at a time，enter $n$ first， （ $⿴ 囗 n C r$ ，then $r$（nonnegative integers only）．No item occurs more than once in a set，and different orders of the same $r$ items are not counted separately．

## Permutations

To calculate the number of possible arrangements of $n$ items taken $r$ at a time，enter $n$ first，$⿴ 囗 \square$ Prr，then $r$（nonnegative integers only）．No item occurs more than once in an arrangement，and different orders of the same $r$ items are counted separately．

## Seed

To store the number in $x$ as a new seed for the random number generator，press $\rightarrow$ SEED．

## Random number generator

To generate a random number in the range $0 \leq x<1$ ，press RAND．（The number is part of a uniformly－distributed pseudo－random number sequence．It passes the spectral test of D．Knuth，The Art of Computer Programming，vol．2， Seminumerical Algorithms，London：Addison Wesley，1981．）

The RANDOM function uses a seed to generate a random number. Each random number generated becomes the seed for the next random number. Therefore, a sequence of random numbers can be repeated by starting with the same seed. You can store a new seed with the SEED function. If memory is cleared, the seed is reset to zero. A seed of zero will result in the calculator generating its own seed.

## Example: Combinations of People.

A company employing 14 women and 10 men is forming a six-person safety committee. How many different combinations of people are possible?
Keys:
Display:
Description:

| 24 ENTER 6 | $6_{-}$ | Twenty-four people grouped six <br> at a time. |
| :--- | :--- | :--- |
| (4) $n C r$ | $134,596.0000$ | Total number of combinations <br> possible. |

If employees are chosen at random, what is the probability that the committee will contain six women? To find the probability of an event, divide the number of combinations for that event by the total number of combinations.

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| 14 ENTER 6 | 6 | Fourteen women grouped six at a time. |
| (6) ${ }^{\mathrm{nCr}}$ | 3,003.0000 | Number of combinations of six women on the committee. |
| $x$ | 134,596.0000 | Brings total number of combinations back into the X-register. |
| $\div$ | 0.0223 | Divides combinations of women by total combinations to find probability that any one combination would have all women. |

## Parts of Numbers

These functions are primarily used in programming．

## Integer part

To remove the fractional part of $x$ and replace it with zeros，press $\mathbb{\square}$ ．（For example，the integer part of 14.2300 is 14.0000 ．）

## Fractional part

To remove the integer part of $x$ and replace it with zeros，press $\square \mathbb{F}$ ．（For example，the fractional part of 14.2300 is 0.2300 ）

## Absolute value

To replace $x$ with its absolute value，press $⿴ 囗 大$ ABS．

## Sign value

To indicate the sign of $x$ ，press $\boldsymbol{S G N}$ ．If the $x$ value is negative，-1.0000 is displayed；if zero， 0.0000 is displayed；if positive， 1.0000 is displayed．

## Greatest integer

To obtain the greatest integer equal to or less than given number，press $\rightarrow$ INTG．

## Example：

## To calculate：

The integer part of 2.47
The fractional part of 2.47
The absolute value of－7
The sign value of 9
The greatest integer equal to or less than -5.3

The RND function（国 RND ）rounds $x$ internally to the number of digits specified by the display format．（The internal number is represented by 12 digits．） Refer to chapter 5 for the behavior of RND in Fraction－display mode．

## Names of Functions

You might have noticed that the name of a function appears in the display when you press and hold the key to execute it. (The name remains displayed for as long as you hold the key down.) For instance, while pressing SIN, the display shows SII. "SIN" is the name of the function as it will appear in program lines (and usually in equations also).

## 5

## Fractions

"Fractions" in chapter 1 introduces the basics about entering, displaying, and calculating with fractions:

- To enter a fraction, press $\square$ twice - after the integer part, and between the numerator and denominator. To enter $23 / 8$, press $2 \square 3 \square \cdot$ 8. To enter $5 / 8$, press $\bullet 5 \square 8$ or $5 \square \bullet \bullet 8$.
- To turn Fraction-display mode on and off, press FDISP. When you turn off Fraction-display mode, the display goes back to the previous display format. (FIX, SCI, ENG, and ALL also turn off Fraction-display mode.)
- Functions work the same with fractions as with decimal numbers - except for RND, which is discussed later in this chapter.

This chapter gives more information about using and displaying fractions.

## Entering Fractions

You can type almost any number as a fraction on the keyboard - including an improper fraction (where the numerator is larger than the denominator). However, the calculator displays $\boldsymbol{\Delta}$ if you disregard these two restrictions:

- The integer and numerator must not contain more than 12 digits total.
- The denominator must not contain more than 4 digits.

## Example:

Keys: Display: Description:
(-7) FDISP
1.5 ENTER
$1-3 \square 4$ ENTER
(F) FDISP
(G) FDISP

Turns on Fraction-display mode.
Enters 1.5; shown as a fraction.
Enters $13 / 4$.
Displays $x$ as a decimal number.
Displays $x$ as a fraction.

If you didn't get the same results as the example, you may have accidentally changed how fractions are displayed. (See "Changing the Fraction Display" later in this chapter.)

The next topic includes more examples of valid and invalid input fractions.
You can type fractions only if the number base is 10 - the normal number base. See chapter 10 for information about changing the number base.

## Fractions in the Display

In Fraction-display mode, numbers are evaluated internally as decimal numbers, then they're displayed using the most precise fractions allowed. In addition, accuracy annunciators show the direction of any inaccuracy of the fraction compared to its 12 -digit decimal value. (Most statistics registers are exceptions they're always shown as decimal numbers.)

## Display Rules

The fraction you see may differ from the one you enter. In its default condition, the calculator displays a fractional number according to the following rules. (To change the rules, see "Changing the Fraction Display" later in this chapter.)

- The number has an integer part and, if necessary, a proper fraction (the numerator is less than the denominator).
- The denominator is no greater than 4095.
- The fraction is reduced as far as possible.

## Examples:

These are examples of entered values and the resulting displays. For comparison, the internal 12-digit values are also shown. The $\mathbf{\Delta}$ and $\mathbf{\nabla}$ annunciators in the last column are explained below.

| Entered Value | Internal Value | Displayed Fraction |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $23 / 8$ | 2.37500000000 | 2 | $3 / 8$ |  |
| $14^{15 / 32}$ | 14.4687500000 |  | 15/32 |  |
| 54/12 | 4.50000000000 | 4 |  |  |
| 618/5 | 9.60000000000 | 9 |  |  |
| 34/12 | 2.83333333333 | 2 | $5 / 6$ | $\nabla$ |
| 15/8192 | 0.00183105469 | 0 | $7 / 3823$ | A |
| 12345678 12345/3 | (lllegal entry) |  |  | $\Delta$ |
| $16^{3 / 16384}$ | (Illegal entry) |  |  | A |

## Accuracy Indicators

The accuracy of a displayed fraction is indicated by the $\boldsymbol{\Delta}$ and $\boldsymbol{\nabla}$ annunciators at the right of the display. The calculator compares the value of the fractional part of the internal 12-digit number with the value of the displayed fraction:

- If no indicator is lit, the fractional part of the internal 12-digit value exactly matches the value of the displayed fraction.
- If $\boldsymbol{\nabla}$ is lit, the fractional part of the internal 12-digit value is slightly less than the displayed fraction - the exact numerator is no more than 0.5 below the displayed numerator.
- If $\boldsymbol{\Delta}$ is lit, the fractional part of the internal 12-digit value is slightly greater than the displayed fraction - the exact numerator is no more than 0.5 above the displayed numerator.

This diagram shows how the displayed fraction relates to nearby values $-\boldsymbol{\Delta}$ means the exact numerator is "a little above" the displayed numerator, and $\boldsymbol{\nabla}$ means the exact numerator is "a little below".

This is especially important if you change the rules about how fractions are displayed. (See "Changing the Fraction Display" later.) For example, if you force all fractions to have 5 as the denominator, then $2 / 3$ is displayed as $03 / 54$ because the exact fraction is approximately $3.3333 / 5$, "a little above" $3 / 5$. Similarly, $-2 / 3$ is displayed as $-3 / 5 \Delta$ because the true numerator is "a little above" 3.

Sometimes an annunciator is lit when you wouldn't expect it to be. For example, if you enter $2 \frac{2}{3}$, you see $\mathbf{2} 2 / 3 \boldsymbol{\Delta}$, even though that's the exact number you entered. The calculator always compares the fractional part of the internal value and the 12-digit value of just the fraction. If the internal value has an integer part, its fractional part contains less than 12 digits - and it can't exactly match a fraction that uses all 12 digits.

## Longer Fractions

If the displayed fraction is too long to fit in the display, it's shown with ... at the beginning. The fraction part always fits - the ... means the integer part isn't shown completely. To see the integer part (and the decimal fraction), press and hold SHOW. (You can't scroll a fraction in the display.)

## Example:

Keys:
Display:
Description:

| $14 e^{x}$ | ... 2604 888/3125 | Calculates $\mathrm{e}^{14}$. |
| :---: | :---: | :---: |
| T SHOW | 1202604.28416 | Shows all decimal digits. |
| STO A | ... $26044888 / 3125$ | Stores value in $A$. |
| [-7 VIEW A | $\mathrm{f}=$ | Views $A$. |

C C
0
Clears $x$.

## Changing the Fraction Display

In its default condition, the calculator displays a fractional number according to certain rules. (See "Display Rules" earlier in this chapter.) However, you can change the rules according to how you want fractions displayed:

- You can set the maximum denominator that's used.
- You can select one of three fraction formats.

The next few topics show how to change the fraction display.

## Setting the Maximum Denominator

For any fraction, the denominator is selected based on a value stored in the calculator. If you think of fractions as $a b / c$, then $/ c$ corresponds to the value that controls the denominator.

The /c value defines only the maximum denominator used in Fraction-display mode - the specific denominator that's used is determined by the fraction format (discussed in the next topic).

- To set the / c value, press $n \rightarrow$, where $n$ is the maximum denominator you want. n can't exceed 4095. This also turns on Fraction-display mode.
- To recall the /c value to the X -register, press 1 (c)
- To restore the default value or 4095, press 0 . (You also restore the default if you use 4095 or greater.) This also turns on Fraction-display mode.

The /c function uses the absolute value of the integer part of the number in the X -register. It doesn't change the value in the LAST X register.

## Choosing a Fraction Format

The calculator has three fraction formats. Regardless of the format, the displayed fractions are always the closest fractions within the rules for that format.

- Most precise fractions. Fractions have any denominator up to the $/ \mathrm{c}$ value, and they're reduced as much as possible. For example, if you're studying math concepts with fractions, you might want any denominator to be possible (/c value is 4095). This is the default fraction format.
- Factors of denominator. Fractions have only denominators that are factors of the /c value, and they're reduced as much as possible. For example, if you're calculating stock prices, you might want to see $531 / 4$ and $377 / 8$ (/c value is 8 ). Or if the /c value is 12 , possible denominators are $2,3,4,6$, and 12 .
- Fixed denominator. Fractions always use the /c value as the denominator - they're not reduced. For example, if you're working with time measurements, you might want to see $125 / 60$ ( /c value is 60 ).

To select a fraction format, you must change the states of two flags. Each flag can be "set" or "clear," and in one case the state of flag 9 doesn't matter.

| To Get This Fraction Format: | Change These Flags: |  |
| :--- | :---: | :---: |
|  | $\mathbf{8}$ | $\mathbf{9}$ |
| Most precise | Clear | - |
| Factors of denominator | Set | Clear |
| Fixed denominator | Set | Set |

You can change flags 8 and 9 to set the fraction format using the steps listed here. (Because flags are especially useful in programs, their use is covered in detail in chapter 13.)

1. Press FLAGS to get the flag menu.
2. To set a flag, press $\{\mathrm{SF}\}$ and type the flag number, such as 8 .

To clear a flag, press (CF) and type the flag number.
To see if a flag is set, press $\{F S ?\}$ and type the flag number. Press $[$ d or $\varangle$ to clear the YES or HO response.

## Examples of Fraction Displays

The following table shows how the number 2.77 is displayed in the three fraction formats for two /c values.

| Fraction Format | How 2.77 Is Displayed |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $/ c=4095$ |  | $/ c=16$ |  |
| Most Precise | $277 / 100$ | (2.7700) | 2 10/134 | ${ }^{(2.7692)}$ |
| Factors of Denominator | 2 1051/1365 | (2.7699) | $23 / 4 \pm$ | (2.7500) |
| Fixed Denominator | $23153 / 4095$ A | (2.7699) | $212 / 16 \pm$ | (2.7500) |

The following table shows how different numbers are displayed in the three fraction formats for a/c value of 16 .

| Fraction Format＊ | Number Entered and Fraction Displayed |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2 | 2.5 | $22 / 3$ | 2.9999 | 216／25 |
| Most precise | 2 | $21 / 2$ | 22／34 | 3 V | 29／14 |
| Factors of denominator | 2 | 2 1／2 | 211／16 | 3 V | 25／8ム |
| Fixed denominator | 20／16 | 28／16 | 211／16 V | $30 / 16$ V | $210 / 16 \pm$ |
| ＊For a／c value of 16 ． |  |  |  |  |  |

## Example：

Suppose a stock has a current value of $481 / 4$ ．If it goes down $25 / 8$ ，what would be its value？What would then be 85 percent of that value？

Keys：
H FLAGS $\{\mathrm{SF}\} 8$ 回 FLAGS \｛CF\} 9

8 回
$48 \cdot \cdot 1$ ENTER
$2 \square 5 \square \square$
85 \％
$48 \quad 1 / 4$
Display：

Description：
Sets flag 8，clears flag 9 for ＂factors of denominator＂ format．
Sets up fraction format for $1 / 8$ increments．
Enters the starting value．
Subbracts the change．
Finds the 85－percent value to the nearest $1 / 8$ ．

## Rounding Fractions

If Fraction－display mode is active，the RND function converts the number in the X－register to the closest decimal representation of the fraction．The rounding is done according to the current $/ \mathrm{c}$ value and the states of flags 8 and 9 ．The accuracy indicator turns off if the fraction matches the decimal representation exactly．Otherwise，the accuracy indicator stays on，（See＂Accuracy Indicators＂ earlier in this chapter．）

In an equation or program, the RND function does fractional rounding if Fraction-display mode is active.

## Example:

Suppose you have a $563 / 4$-inch space that you want to divide into six equal sections. How wide is each section, assuming you can conveniently measure $1 / 16$-inch increments? What's the cumulative roundoff error?

| Keys: | Display: | Description: <br> Sets up fraction format for |
| :--- | :--- | :--- |
| 1/16-inch increments. (Flags 8 |  |  |
| and 9 should be the same as for |  |  |
| the previous example.) |  |  |

## Fractions in Equations

When you're typing an equation, you can't type a number as a fraction. When an equation is displayed, all numeric values are shown as decimal values -Fraction-display mode is ignored.

When you're evaluating an equation and you're prompted for variable values, you may enter fractions - values are displayed using the current display format. See chapter 6 for information about working with equations.

## Fractions in Programs

When you're typing a program, you can type a number as a fraction - but it's converted to its decimal value. All numeric values in a program are shown as decimal values - Fraction-display mode is ignored.

When you're running a program, displayed values are shown using Fraction-display mode if it's active. If you're prompted for values by INPUT instructions, you may enter fractions, regardless of the display mode.

A program can control the fraction display using the /c function and by setting and clearing flags 7, 8, and 9. Setting flag 7 turns on Fraction-display mode (FDISP isn't programmable. See "Flags" in chapter 13.

See chapters 12 and 13 for information about working with programs.

## 6

## Entering and Evaluating Equations

## How You Can Use Equations

You can use equations on the HP 33s in several ways:

- For specifying an equation to evaluate (this chapter).
- For specifying an equation to solve for unknown values (chapter 7).
- For specifying a function to integrate (chapter 8).

## Example: Calculating with an Equation.

Suppose you frequently need to determine the volume of a straight section of pipe. The equation is

$$
V=.25 \pi d^{2}
$$

where $d$ is the inside diameter of the pipe, and $l$ is its length.
You could key in the calculation over and over; for example, 25 ENTER $\rightarrow$
 diameter pipe ( 78.5398 cubic inches). However, by storing the equation, you get the HP 33s to "remember" the relationship between diameter, length, and volume - so you can use it many times.

Put the calculator in Equation mode and type in the equation using the following keystrokes:

Keys:
$\rightarrow$ EQN

Display:
EDHLIST TOP or the current equation

## Description:

Selects Equation mode, shown by the EQN annunciator.

Begins a new equation, turning on the "【" equation-entry cursor. RCL turns on the A..Z annunciator so you can enter a variable name.

| $\vee \square$ | $V=\square$ | RCL $V$ types $V$ and moves the cursor to the right. |
| :---: | :---: | :---: |
| . 25 | $v=0.25$ | Digit entry uses the "_" digit-entry cursor. |
| x $\rightarrow$ ¢ $x$ | $\mathrm{V}=0.25 \times \pi \times \square$ | $x$ ends the number and restores the " ${ }^{\text {D" }}$ cursor. |
| RCL D $y^{\boldsymbol{x}} 2$ | $\mathrm{V}=0.25 \times \pi \times \mathrm{D}^{\wedge} \quad 2{ }^{2}$ | $y^{x}$ types ${ }^{*}$. |
| $x$ RCL L | $\mathrm{V}=0.25 \times \pi \times \square \times 2 \times \mathrm{L}$ |  |
| ENTER | $v=0.25 \times \pi \times \square \times 2 \times L$ | Terminates and displays the equation. |
| [ $\rightarrow$ SHOW | $\mathrm{CK}=49 \mathrm{CA}$ | Shows the checksum and length |
|  | L $\mathrm{l}=14$ | for the equation, so you can check your keystrokes. |

By comparing the checksum and length of your equation with those in the example, you can verify that you've entered the equation properly. (See "Verifying Equations" at the end of this chapter for more information.)

Evaluate the equation ( to calculate $V$ ):

Keys:

| ENTER | D? |
| :---: | :---: |
|  | value |
| $2 \square 1 \square 2$ | 0? |
|  | $21 / 2$ |
| R/S | L? |
|  | value |
| 16 R/S | $\mathrm{V}=$ |
|  | 78.5398 |

Display:
D?
value
78.5398

## Description:

Prompts for variables on the right-hand side of the equation. Prompts for $D$ first; value is the current value of $D$.
Enters $2 \mathrm{l} / 2$ inches as a fraction.

Stores $D$, prompts for $L$; value is current value of $L$.
Stores $L$; calculates $V$ in cubic inches and stores the result in $V$.

## 6-2 Entering and Evaluating Equations

## Summary of Equation Operations

All equations you create are saved in the equation list. This list is visible whenever you activate Equation mode.

You use certain keys to perform operations involving equations. They're described in more detail later.

| Key | Operation |
| :---: | :---: |
| $\rightarrow$ EQN | Enters and leaves Equation mode. |
| ENTER | Evaluates the displayed equation. If the equation is an assignment, evaluates the right-hand side and stores the result in the variable on the left-hand side. If the equation is an equality or expression, calculates its value like XEQ. (See "Types of Equations" later in this chapter.) |
| XEQ | Evaluates the displayed equation. Calculates its value, replacing "=" with "-" if an "=" is present. |
| SOLVE | Solves the displayed equation for the unknown variable you specify. (See chapter 7.) |
| $\rightarrow$ | Integrates the displayed equation with respect to the variable you specify. (See chapter 8.) |
| $\leftarrow$ | Begins editing the displayed equation; subsequent presses delete the rightmost function or variable. |
| (4) CLEAR | Deletes the displayed equation from the equation list. |
| $\uparrow$ or $\downarrow$ | Steps up or down through the equation list. |
| (T) | Goes to the top line of the equation or program list. |
| (-7) | Goes to the last line of the equation or program list. |
| $\rightarrow$ SHOW | Shows the displayed equation's checksum (verification value) and length (bytes of memory). |
| C | Leaves Equation mode. |

You can also use equations in programs - this is discussed in chapter 12.

## Entering Equations into the Equation List

The equation list is a collection of equations you enter. The list is saved in the calculator's memory. Each equation you enter is automatically saved in the equation list.

## To enter an equation:

1. Make sure the calculator is in its normal operating mode, usually with a number in the display. For example, you can't be viewing the catalog of variables or programs.
2. Press EQN. The EQN annunciator shows that Equation mode is active, and an entry from the equation list is displayed.
3. Start typing the equation. The previous display is replaced by the equation you're entering - the previous equation isn't affected. If you make a mistake, press $\measuredangle$ as required. You can enter up to 255 characters per equation.
4. Press ENTER to terminate the equation and see it in the display. The equation is automatically saved in the equation list - right after the entry that was displayed when you started typing. (If you press $[\mathbf{C}$ instead, the equation is saved, but Equation mode is turned off.)

You can make an equation as long as you want - you're limited only by the amount of memory available.

Equations can contain variables, numbers, functions, and parentheses - they're described in the following topics. The example that follows illustrates these elements.

## Variables in Equations

You can use any of the calculator's 28 variables in an equation: A through $Z, i$, and (i). You can use each variable as many times as you want. (For information about (i), see "Indirectly Addressing Variables and Labels" in chapter 13.)

To enter a variable in an equation, press RCL variable (or STO] variable). When you press RCL, the $\mathbf{A} . . \mathbf{Z}$ annunciator shows that you can press a variable key to enter its name in the equation.

## Numbers in Equations

You can enter any valid number in an equation except fractions and numbers that aren't base 10 numbers. Numbers are always shown using ALL display format, which displays up to 12 characters.

To enter a number in an equation, you can use the standard number-entry keys, including $\square, \pm$, $+\square$, and $E$. Press $+\square$ only after you type one or more digits. Don't use $+\square$ for subtraction.

When you start entering the number, the cursor changes from "■" to "_" to show numeric entry. The cursor changes back when you press a nonnumeric key.

## Functions in Equations

You can enter many HP 33s functions in an equation. A complete list is given under "Equation Functions" later in this chapter. Appendix G, "Operation Index," also gives this information.

When you enter an equation, you enter functions in about the same way you put them in ordinary algebraic equations:

- In an equation, certain functions are normally shown between their arguments, such as " + " and " $\div$ ". For such infix operators, enter them in an equation in the same order.
- Other functions normally have one or more arguments after the function name, such as "COS" and "LN". For such prefix functions, enter them in an equation where the function occurs - the key you press puts a left parenthesis after the function name so you can enter its arguments.

If the function has two or more arguments, press : $:$ (on the $R \downarrow$ key) to separate them.

If the function is followed by other operations, press $\square$ to complete the function arguments.

## Parentheses in Equations

You can include parentheses in equations to control the order in which operations are performed. Press $\square \square$ and $\square \square$ to insert parentheses. (For more information, see "Operator Precedence" later in this chapter.)

## Example: Entering an Equation.

Enter the equation $r=2 \times c \times \cos (t-a)+25$

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| $\rightarrow$ EQN | $\mathrm{V}=0.25 \times \pi \times \mathrm{D}^{\wedge} \times 2 \times \mathrm{L}$ | Shows the last equation used in the equation list. |
| RCL R ( ${ }^{\text {a }}$ | $\mathrm{R}=$ ■ | Starts a new equation with variable $R$. |
| 2 | $\mathrm{R}=z_{-}$ | Enters a number, changing the cursor to "_". |
| x RCL $\subset \times$ | $\mathrm{R}=2 \times \mathrm{C} \times$ ■ | Enters infix operators. |
| COS | $\mathrm{R}=2 \times \mathrm{C} \times \operatorname{cose} \mathrm{C}$ | Enters a prefix function with a left parenthesis. |
| RCL $T$ R RCL A |  | Enters the argument and right |
| (T) H $^{\text {+ }}$ | $\times \operatorname{Cos}(\mathrm{T}-\mathrm{B})+25$ | parenthesis. |
| ENTER | $\mathrm{R}=2 \times \mathrm{C} \times \cos (\mathrm{T}-\mathrm{A})$ | Terminates the equation and displays it. |
| B SHOW | CK=1010 | Shows its checksum and length. |
|  | Lif $=17$ |  |
| (c) |  | Leaves Equation mode. |

## Displaying and Selecting Equations

The equation list contains the equations you've entered. You can display the equations and select one to work with.

## To display equations:

1. Press EQN. This activates Equation mode and turns on the EQN annunciator. The display shows an entry from the equation list:

- EQN LIST TOF if there are no equations in the equation list or if the equation pointer is at the top of the list.
- The current equation (the last equation you viewed).

2. Press $\uparrow$ or $\downarrow$ to step through the equation list and view each equation. The list "wraps around" at the top and bottom. EQN LIST TOF marks the "top" of the list.

## To view a long equation:

1. Display the equation in the equation list, as described above. If it's more than 14 characters long, only 14 characters are shown. The $\Rightarrow$ annunciator indicates more characters to the right.
2. Press $\rightarrow$ to scroll the equation one character at a time, showing characters to the right. Press $\leftrightarrows$ to show characters to the left. $\boldsymbol{\sigma}$ and $\Rightarrow$ turn off if there are no more characters to the left or right.

## To select an equation:

Display the equation in the equation list, as described above. The displayed equation is the one that's used for all equation operations.

## Example: Viewing an Equation.

View the last equation you entered.

Keys:
Display:

## Description:

| ( EQN | $\mathrm{R}=2 \times \mathrm{C} \times \cos (\mathrm{T}-\mathrm{A})$ |
| :---: | :---: |
| $\rightarrow \rightarrow$ | $\times \mathrm{Cx} \cos (\mathrm{T}-\mathrm{A})+25$ |
| $\square$ | $2 \times \operatorname{cocos}(\mathrm{T}-\mathrm{A})+2$ |
| [ |  |

Displays the current equation in the equation list.
Shows three more characters to the right.
Shows one character to the left. Leaves Equation mode.

## Editing and Clearing Equations

You can edit or clear an equation that you're typing. You can also edit or clear equations saved in the equation list.

## To edit an equation you＇re typing：

1．Press $\leftrightarrows$ repeatedly until you delete the unwanted number or function．

If you＇re typing a decimal number and the＂＿＂digit－entry cursor is on，$\square$ deletes only the rightmost character．If you delete all characters in the number， the calculator switches back to the＂\＄＂equation－entry cursor．

If the＂【＂equation－entry cursor is on，pressing $\leftrightarrows$ deletes the entire rightmost number or function．

2．Retype the rest of the equation．
3．Press ENTER（or $\mathbb{C}$ ）to save the equation in the equation list．

## To edit a saved equation：

1．Display the desired equation．（See＂Displaying and Selecting Equations＂ above．）
2．Press $\leftrightarrows$（once only）to start editing the equation．The＂【＂equation－entry cursor appears at the end of the equation．Nothing is deleted from the equation．
3．Use to edit the equation as described above．
4．Press ENTER（or ）to save the edited equation in the equation list， replacing the previous version．

## To clear an equation you＇re typing：

Press［⿴囗 $⿴ 囗 ⿰ 丿 ㇄$ the equation list．

## To clear a saved equation：

1．Display the desired equation．（See＂Displaying and Selecting Equations＂ above．）
2．Press CLEAR．The display shows the previous entry in the equation list．
To clear all equations，clear them one at a time：scroll through the equation list until you come to EQH LIST TOF，press $\uparrow$ ，then press $⿴ 囗$ CLEAR repeatedly as each equation is displayed until you see EQN LIST TOF．

## Example：Editing an Equation．

Remove 25 in the equation from the previous example．

Keys:
Display:
Description:
$\rightarrow$ EQN

$\bar{C} \times 0.5(T-B)+25 \square$
$=2 \times \mathrm{C} \times \mathrm{COS}(\mathrm{T}-\mathrm{B}) \boldsymbol{\square}$
$\mathrm{R}=2 \times \mathrm{C} \times \mathrm{Cos}(\mathrm{T}-\mathrm{A})$
$\mathrm{R}=2 \times \mathrm{C} \times \cos (\mathrm{T}-\mathrm{A}) \quad$ Shows the current equation in the equation list.
Turns on Equation-entry mode and shows the "■" cursor at the end of the equation.
Deletes the number 25 .
Shows the end of edited equation in the equation list. Leaves Equation mode.

## Types of Equations

The HP 33s works with three types of equations:
■ Equalities. The equation contains an " $=$ ", and the left side contains more than just a single variable. For example, $x^{2}+y^{2}=r^{2}$ is an equality.

- Assignments. The equation contains an " $=$ ", and the left side contains just a single variable. For example, $A=0.5 \times b \times h$ is an assignment.
- Expressions. The equation does not contain an "=". For example, $x^{3}+1$ is an expression.

When you're calculating with an equation, you might use any type of equation although the type can affect how it's evaluated. When you're solving a problem for an unknown variable, you'll probably use an equality or assignment. When you're integrating a function, you'll probably use an expression.

## Evaluating Equations

One of the most useful characteristics of equations is their ability to be evaluated - to generate numeric values. This is what enables you to calculate a result from an equation. (It also enables you to solve and integrate equations, as described in chapters 7 and 8).

Because many equations have two sides separated by " $=$ ", the basic value of an equation is the difference between the values of the two sides. For this calculation, "=" in an equation essentially treated as "-". The value is a measure of how well the equation balances.

The HP 33s has two keys for evaluating equations: ENTER and XEQ. Their actions differ only in how they evaluate assignment equations:

- XEQ returns the value of the equation, regardless of the type of equation.
- ENTER returns the value of the equation - unless it's an assignment-type equation. For an assignment equation, ENTER] returns the value of the right side only, and also "enters" that value into the variable on the left side - it stores the value in the variable.

The following table shows the two ways to evaluate equations.

| Type of Equation | Result for ENTER | Result for XEQ |
| :---: | :---: | :---: |
| Equality: $g(x)=f(x)$ <br> Example: $x^{2}+y^{2}=r^{2}$ | $\begin{gathered} g(x)-f(x) \\ x^{2}+y^{2}-r^{2} \end{gathered}$ |  |
| Assignment: $y=f(x)$ <br> Example: $A=0.5 \times b \times h$ | $\begin{gathered} f(x)^{*} \\ 0.5 \times b \times h^{*} \end{gathered}$ | $\begin{gathered} y-f(x) \\ A-0.5 \times b \times h \end{gathered}$ |
| Expression: $f(x)$ <br> Example: $x^{3}+1$ | $\begin{gathered} f(x) \\ x^{3}+1 \end{gathered}$ |  |

* Also stores the result in the left-hand variable, A for example.

## To evaluate an equation:

1. Display the desired equation. (See "Displaying and Selecting Equations" above.)
2. Press ENTER or XEQ. The equation prompts for a value for each variable needed. (If you've changed the number base, it's automatically changed back to base 10.)
3. For each prompt, enter the desired value:

- If the displayed value is good, press R/S.
- If you want a different value, type the value and press R/S. (Also see "Responding to Equation Prompts" later in this chapter.)

The evaluation of an equation takes no values from the stack - it uses only numbers in the equation and variable values. The value of the equation is returned to the X -register. The LAST X register isn't affected.

## Using ENTER for Evaluation

If an equation is displayed in the equation list, you can press ENTER to evaluate the equation. (If you're in the process of typing the equation, pressing ENTER only ends the equation - it doesn't evaluate it.)

- If the equation is an assignment, only the right-hand side is evaluated. The result is returned to the X -register and stored in the left-hand variable, then the variable is VIEWed in the display. Essentially, ENTER finds the value of the left-hand variable.
- If the equation is an equality or expression, the entire equation is evaluated - just as it is for XEQ. The result is returned to the X -register.

## Example: Evaluating an Equation with ENTER.

Use the equation from the beginning of this chapter to find the volume of a $35-\mathrm{mm}$ diameter pipe that's 20 meters long.

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| $\begin{aligned} & \square \text { EQN } \\ & \text { ( } \uparrow \text { as required) } \end{aligned}$ | $\mathrm{v}=0.25 \times \pi \times \mathrm{D} \times 2 \times \mathrm{L}$ | Displays the desired equation. |
| ENTER | $\begin{aligned} & \mathrm{D} ? \\ & 2.5000 \end{aligned}$ | Starts evaluating the assignment equation so the value will be stored in $V$. Prompts for variables on the right-hand side of the equation. The current value for $D$ is 2.5000 . |
| 35 R/S | $\begin{aligned} & L ? \\ & 16.0000 \end{aligned}$ | Stores $D$, prompts for $L$, whose current value is 16.0000 . |
| $\begin{aligned} & 20 \text { ENTER } 1000 \\ & \mathbf{x} \text { R/S } \end{aligned}$ | $\begin{aligned} & \mathrm{V}= \\ & 19,242,255 \cdot 0032 \end{aligned}$ | Stores Lin millimeters; calculates $V$ in cubic millimeters, stores the result in $V$, and displays $V$. |

Changes cubic millimeters to liters (but doesn't change $V$ ).

## Using XEQ for Evaluation

If an equation is displayed in the equation list, you can press XEQ to evaluate the equation. The entire equation is evaluated, regardless of the type of equation. The result is returned to the X -register.

## Example: Evaluating an Equation with XEQ.

Use the results from the previous example to find out how much the volume of the pipe changes if the diameter is changed to 35.5 millimeters.

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| $\rightarrow$ EQN | $V=0.25 \times \pi \times \square \times 2 \times L$ | Displays the desired equation. |
| XEQ | $\begin{aligned} & v ? \\ & 19,242 \cdot 255 \cdot 0032 \end{aligned}$ | Starts evaluating the equation to find its value. Prompts for all variables. |
| R/S | [? | Keeps the same V, prompts for $D$. |
|  | 35.0006 |  |
| $35.5 \mathrm{R} / \mathrm{S}$ | L? | Stores new D, Prompts for L. |
|  | 20.006.0606 |  |
| R/S | -553.705.7052 | Keeps the same $L$; calculates the value of the equation - the imbalance between the left and right sides. |
| E $6 \div$ | -0. 0.553 | Changes cubic millimeters to liters. |

The value of the equation is the old volume (from V) minus the new volume (calculated using the new $D$ value) - so the old volume is smaller by the amount shown.

## Responding to Equation Prompts

When you evaluate an equation, you're prompted for a value for each variable that's needed. The prompt gives the variable name and its current value, such as X72.5060.

- To leave the number unchanged, just press R/S.
- To change the number, type the new number and press $R / S$. This new number writes over the old value in the X -register. You can enter a number as a fraction if you want. If you need to calculate a number, use normal keyboard calculations, then press R/S. For example, you can press 2 ENTER $5{ }^{y x}$ R/S.
- To calculate with the displayed number, press ENTER before typing another number.
- To cancel the prompt, press $C$. The current value for the variable remains in the X -register. If you press $C$ during digit entry, it clears the number to zero. Press $[$ again to cancel the prompt.
- To display digits hidden by the prompt, press SHOW.

Each prompt puts the variable value in the X -register and disables stack lift. If you type a number at the prompt, it replaces the value in the X -register. When you press $\mathbb{R / S}$, stack lift is enabled, so the value is retained on the stack.

## The Syntax of Equations

Equations follow certain conventions that determine how they're evaluated:

- How operators interact.
- What functions are valid in equations.
- How equations are checked for syntax errors.

## Operator Precedence

Operators in an equation are processed in a certain order that makes the evaluation logical and predictable:

| Order | Operation | Example |
| :---: | :---: | :---: |
| 1 | Functions and Parentheses | $5 \mathrm{I}+(X+1),(X+1)$ |
| 2 | Power ( $\nu^{x}$ ) | $8 \times 3$ |
| 3 | Unary Minus ( + + | - H |
| 4 | Multiply and Divide | $\mathrm{X} \times \mathrm{Y}, \mathrm{H} \div \mathrm{B}$ |
| 5 | Add and Subtract | $\mathrm{P}+\mathrm{Q}, \mathrm{A}-\mathrm{B}$ |
| 6 | Equality | $\mathrm{B}=\mathrm{C}$ |

So, for example, all operations inside parentheses are performed before operations outside the parentheses.

## Examples:

| Equations | Meaning |
| :--- | :--- |
| $\mathrm{A} \times \mathrm{B} \times 3=\mathrm{C}$ | $a \times\left(b^{3}\right)=\mathrm{c}$ |
| $(\mathrm{A} \times \mathrm{B}) \times 3=\mathrm{C}$ | $(a \times b)^{3}=\mathrm{c}$ |
| $\mathrm{H}+\mathrm{B} \div \mathrm{C}=12$ | $a+(b / c)=12$ |
| $(\mathrm{H}+\mathrm{B}) \div \mathrm{C}=12$ | $(a+b) / c=12$ |
| $\mathrm{CCHC}(\mathrm{T}+12: \mathrm{A}-6) \times 2$ | $[\% \mathrm{CHG}((t+12),(a-6))]^{2}$ |

You can't use parentheses for implied multiplication. For example, the expression $p(1-f)$ must be entered as $F \times(1-F)$, with the " $x$ " operator inserted between $P$ and the left parenthesis.

## Equation Functions

The following table lists the functions that are valid in equations. Appendix G, "Operation Index" also gives this information.

| LN | LOG | EXP | ALOG | SQ | SQRT |
| :--- | :--- | :--- | :--- | :--- | :--- |
| INV | IP | FP | RND | ABS | $x!$ |
| SGN | INTG | IDIV | RMDR |  |  |
| SIN | COS | TAN | ASIN | ACOS | ATAN |
| SINH | COSH | TANH | ASINH | ACOSH | ATANH |
| $\rightarrow$ DEG | $\rightarrow$ RAD | $\rightarrow$ HR | $\rightarrow$ HMS | \%CHG | XROOT |
| CB | CBRT | Cn,r | Pn,r |  |  |
| $\rightarrow$ KG | $\rightarrow$ LB | $\rightarrow{ }^{\circ} \mathrm{C}$ | $\rightarrow{ }^{\circ} \mathrm{F}$ | $\rightarrow$ CM | $\rightarrow$ IN |
| $\rightarrow$ L | $\rightarrow$ GAL | RANDOM | $\pi$ |  |  |
| + | - | $\times$ | $\div$ | $\wedge$ |  |
| $s x$ | $s y$ | $\sigma x$ | $\sigma y$ | $\bar{x}$ | $\bar{y}$ |
| $\bar{x} w$ | $\hat{x}$ | $\hat{y}$ | $r$ | $m$ | $b$ |
| $n$ | $\Sigma x$ | $\Sigma y$ | $\Sigma x^{2}$ | $\Sigma y^{2}$ | $\Sigma x y$ |

For convenience, prefix-type functions, which require one or two arguments, display a left parenthesis when you enter them.

The prefix functions that require two arguments are \%CHG, RND, XROOT, IDIV, RMDR, Cn,r and Pn,r. Separate the two arguments with a colon.

In an equation, the XROOT function takes its arguments in the opposite order from RPN usage. For example, -8 ENTER $3 \sqrt[x]{\bar{y}}$ to is equivalent to $\mathrm{XROOT}(3 ;-8)$.

All other two-argument functions take their arguments in the $Y, X$ order used for RPN. For example, 28 ENTER 4 nCr is equivalent to $\mathrm{Cr} \times \mathrm{r}(28: 4$ ).

For two-argument functions, be careful if the second argument is negative. For a number or variable, use $+\square$ or $\square$. These are valid equations:

7CHE(- $\mathrm{K}:-2$ )
\%CHE(X: (-Y) )
Eleven of the equation functions have names that differ from their equivalent operations:

| Operation | Equation function |
| :---: | :---: |
| $x^{2}$ | SQ |
| $\sqrt{x}$ | SQRT |
| $e^{x}$ | EXP |
| $10^{x}$ | ALOG |
| $1 / x$ | INV |
| $\sqrt[x]{y}$ | XROOT |
| $y^{x}$ | $\wedge$ |
| $I N T \div$ | IDIV |
| $R m d r$ | RMDR |
| $x^{3}$ | CB |
| $\sqrt[3]{x}$ | CBRT |

## Example: Perimeter of a Trapezoid.

The following equation calculates the perimeter of a trapezoid. This is how the equation might appear in a book:

$$
\text { Perimeter }=a+b+h\left(\frac{1}{\sin \theta}+\frac{1}{\sin \phi}\right)
$$

The following equation obeys the syntax rules for HP 33s equations:

## 6-16 Entering and Evaluating Equations

Single letter name

No implied multiplication

Division is done before addition

The next equation also obeys the syntax rules. This equation uses the inverse function, $I+V(S I H(T)$ ), instead of the fractional form, $1 \div S I H(T)$. Notice that the SIN function is "nested" inside the INV function. (INV is typed by $1 / x$.)

## 

## Example: Area of a Polygon.

The equation for area of a regular polygon with $n$ sides of length $d$ is:

$$
\text { Area }=\frac{1}{4} n d^{2} \frac{\cos (\pi / n)}{\sin (\pi / n)}
$$

You can specify this equation as
$\mathrm{A}=0.25 \times \mathrm{H} \times \mathrm{D} \times 2 \times \mathrm{COS}(\pi \div \mathrm{H}) \div \mathrm{SI} \mathrm{I}(\pi \div \mathrm{H})$
Notice how the operators and functions combine to give the desired equation.
You can enter the equation into the equation list using the following keystrokes:

[^1]
## Syntax Errors

The calculator doesn't check the syntax of an equation until you evaluate the equation and respond to all the prompts - only when a value is actually being calculated. If an error is detected, I SUPL ID EQH is displayed. You have to edit the equation to correct the error. (See "Editing and Clearing Equations" earlier in this chapter.)

By not checking equation syntax until evaluation, the HP 33s lets you create "equations" that might actually be messages. This is especially useful in programs, as described in chapter 12 .

## Verifying Equations

When you're viewing an equation - not while you're typing an equation - you can press SHOW to show you two things about the equation: the equation's checksum and its length. Hold the SHOW key to keep the values in the display.

The checksum is a four-digit hexadecimal value that uniquely identifies this equation. No other equation will have this value. If you enter the equation incorrectly, it will not have this checksum. The length is the number of bytes of calculator memory used by the equation.

The checksum and length allow you to verify that equations you type are correct. The checksum and length of the equation you type in an example should match the values shown in this manual.

## Example: Checksum and Length of an Equation.

Find the checksum and length for the pipe-volume equation at the beginning of this chapter.

| Keys: | Display: | Description: |
| :--- | :--- | :--- |
| 日 EQN | $V=0.25 \times \pi \times \mathrm{D}^{\wedge} 2 \times \mathrm{L}$ | Displays the desired |

## 7

## Solving Equations

In chapter 6 you saw how you can use ENTER to find the value of the left-hand variable in an assignment-type equation. Well, you can use SOLVE to find the value of any variable in any type of equation.

For example, consider the equation

$$
x^{2}-3 y=10
$$

If you know the value of $y$ in this equation, then SOLVE can solve for the unknown $x$. If you know the value of $x$, then SOLVE can solve for the unknown $y$. This works for "word problems" just as well:

$$
\text { Markup } \times \text { Cost }=\text { Price }
$$

If you know any two of these variables, then SOLVE can calculate the value of the third.

When the equation has only one variable, or when known values are supplied for all variables except one, then to solve for $x$ is to find a root of the equation. A root of an equation occurs where an equality or assignment equation balances exactly, or where an expression equation equals zero. (This is equivalent to the value of the equation being zero.)

## Solving an Equation

To solve an equation for an unknown variable:

1. Press $\rightarrow$ EQN and display the desired equation. If necessary, type the equation as explained in chapter 6 under "Entering Equations into the Equation List."
2. Press SOLVE then press the key for the unknown variable. For example, press SOLVE X to solve for $x$. The equation then prompts for a value for every other variable in the equation.
3. For each prompt, enter the desired value:

- If the displayed value is the one you want, press R/S
- If you want a different value, type or calculate the value and press R/S. (For details, see "Responding to Equation Prompts" in chapter 6.)

You can halt a running calculation by pressing $[\mathbf{C}$ or $\mathrm{R} / \mathbf{S}$.
When the root is found, it's stored in the unknown variable, and the variable value is VIEWed in the display. In addition, the X-register contains the root, the Y-register contains the previous estimate, and the Z-register contains the value of the equation at the root (which should be zero).

For some complicated mathematical conditions, a definitive solution cannot be found - and the calculator displays HO ROOT FOUND. See "Verifying the Result" later in this chapter, and "Interpreting Results" and "When SOLVE Cannot Find a Root" in appendix D.

For certain equations it helps to provide one or two initial guesses for the unknown variable before solving the equation. This can speed up the calculation, direct the answer toward a realistic solution, and find more than one solution, if appropriate. See "Choosing Initial Guesses for Solve" later in this chapter.

## Example: Solving the Equation of Linear Motion.

The equation of motion for a free-falling object is:

$$
d=v o t+1 / 2 g t^{2}
$$

where $d$ is the distance, vo is the initial velocity, $t$ is the time, and $g$ is the acceleration due to gravity.

Type in the equation:

## Keys:

(G) CLEAR $\{\mathrm{PLL}\}\left\{\mathrm{Y}^{\prime}\right\}$
$\rightarrow$ EQN

RCL D $\boldsymbol{\square}$ R RLI V
$\boldsymbol{x}$ RCL $T+\quad \mathrm{D}=\mathrm{V} \times \mathrm{T}+\boldsymbol{\square}$

Display:

EQH LIST TOF
or current equation
.5 RCL G $x$ RCL $T$

## 7-2 Solving Equations

$$
\begin{aligned}
& \mathrm{CK}=\mathrm{FB} \mathrm{C} \\
& \mathrm{~L} H=15
\end{aligned}
$$

$g$ (acceleration due to gravity) is included as a variable so you can change it for different units $\left(9.8 \mathrm{~m} / \mathrm{s}^{2}\right.$ or $\left.32.2 \mathrm{ft} / \mathrm{s}^{2}\right)$.

Calculate how many meters an object falls in 5 seconds, starting from rest. Since Equation mode is turned on and the desired equation is already in the display, you can start solving for $D$ :

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| SOLVE | SOLVE_ | Prompts for unknown variable. |
| D | v? | Selects $D$; prompts for $V$. |
|  | value |  |
| 0 R/S | T? | Stores 0 in $V$; prompts for T. |
|  | value |  |
| 5 R/S | E? | Stores 5 in $T$; prompts for G. |
|  | value |  |
| 9.8 R/S | SOLVING | Stores 9.8 in G; solves for $D$. |
|  | [ $=$ |  |
|  | 122.5000 |  |

Try another calculation using the same equation: how long does it take an object to fall 500 meters from rest?

## Example: Solving the Ideal Gas Law Equation.

The Ideal Gas Law describes the relationship between pressure, volume, temperature, and the amount (moles) of an ideal gas:

$$
P \times V=N \times R \times T
$$

where $P$ is pressure (in atmospheres or $N / \mathrm{m}^{2}$ ), $V$ is volume (in liters), $N$ is the number of moles of gas, $R$ is the universal gas constant ( 0.0821 liter-atm/mole $-K$ or $8.314 \mathrm{~J} /$ mole $-K$ ), and $T$ is temperature (Kelvins: $K={ }^{\circ} \mathrm{C}+273.1$ ).

Enter the equation:

Keys:

## Understanding and Controlling SOLVE

SOLVE first attempts to solve the equation directly for the unknown variable. If the attempt fails, SOLVE changes to an iterative(repetitive) procedure. The procedure starts by evaluating the equation using two initial guesses for the unknown variable. Based on the results with those two guesses, SOLVE generates another, better guess. Through successive iterations, SOLVE finds a value for the unknown that makes the value of the equation equal to zero.

When SOLVE evaluates an equation, it does it the same way XEQ does - any " $=$ " in the equation is treated as a " - ". For example, the Ideal Gas Law equation is evaluated as $P \times V-(N \times R \times T)$. This ensures that an equality or assignment equation balances at the root, and that an expression equation equals zero at the root.

Some equations are more difficult to solve than others. In some cases, you need to enter initial guesses in order to find a solution. (See "Choosing Initial Guesses for SOLVE," below.) If SOLVE is unable to find a solution, the calculator displays HO ROOT FHD.

See appendix D for more information about how SOLVE works.

## Verifying the Result

After the SOLVE calculation ends, you can verify that the result is indeed a solution of the equation by reviewing the values left in the stack:

- The X -register (press $[$ d to clear the VIEWed variable) contains the solution (root) for the unknown; that is, the value that makes the evaluation of the equation equal to zero.
- The Y -register (press $[\mathrm{RD}$ ) contains the previous estimate for the root. This number should be the same as the value in the X -register. If it is not, then the root returned was only an approximation, and the values in the X - and Y-registers bracket the root. These bracketing numbers should be close together.
- The Z-register (press $R+$ again) contains this value of the equation at the root. For an exact root, this should be zero. If it is not zero, the root given was only an approximation; this number should be close to zero.
If a calculation ends with the HO ROOT FHD , the calculator could not converge on a root. (You can see the value in the X -register - the final estimate of the root by pressing $\square$ or to clear the message.) The values in the X - and Y -registers bracket the interval that was last searched to find the root. The Z-register contains the value of the equation at the final estimate of the root.
- If the X - and Y -register values aren't close together, or the Z -register value isn't close to zero, the estimate from the $X$-register probably isn't a root.
- If the X - and Y -register values are close together, and the Z -register value is close to zero, the estimate from the X -register may be an approximation to a root.

## Interrupting a SOLVE Calculation

To halt a calculation, press $[$ ] or R/S. The current best estimate of the root is in the unknown variable; use VIEW to view it without disturbing the stack.

## Choosing Initial Guesses for SOLVE

The two initial guesses come from:

- The number currently stored in the unknown variable.
- The number in the X-register (the display).

These sources are used for guesses whether you enter guesses or not. If you enter only one guess and store it in the variable, the second guess will be the same value since the display also holds the number you just stored in the variable. (If such is the case, the calculator changes one guess slightly so that it has two different guesses.)

Entering your own guesses has the following advantages:

- By narrowing the range of search, guesses can reduce the time to find a solution.
- If there is more than one mathematical solution, guesses can direct the SOLVE procedure to the desired answer or range of answers. For example, the equation of linear motion

$$
d=v_{0} t+1 / 2 g t^{2}
$$

can have two solutions for $t$. You can direct the answer to the required solution by entering appropriate guesses.

The example using this equation earlier in this chapter didn't require you to enter guesses before solving for $T$ because in the first part of that example you stored a value for $T$ and solved for $D$. The value that was left in $T$ was a good (realistic) one, so it was used as a guess when solving for $T$.

- If an equation does not allow certain values for the unknown, guesses can prevent these values from occurring. For example,

$$
y=t+\log x
$$

results in an error if $x \leq 0$ (message $\mathbb{H O}$ ROOT FND).
In the following example, the equation has more than one root, but guesses help find the desired root.

## Example: Using Guesses to Find a Root.

Using a rectangular piece of sheet metal 40 cm by 80 cm , form an open-top box having a volume of $7500 \mathrm{~cm}^{3}$. You need to find the height of the box (that is, the amount to be folded up along each of the four sides) that gives the specified volume. A taller box is preferred to a shorter one.

If $H$ is the height, then the length of the box is $(80-2 H)$ and the width is $(40-2 H)$. The volume $V$ is:

$$
V=(80-2 H) \times(40-2 H) \times H
$$

which you can simplify and enter as

$$
V=(40-H) \times(20-H) \times 4 \times H
$$

Type in the equation:

Keys:
$\rightarrow$ EQN
$\mathrm{RCL} \vee \vec{r} \quad \mathrm{~V}=\square$
$\rightarrow \square$
$R C L H \rightarrow \quad W=(4, \quad H-H)$
$x \rightarrow \square 20 \rightarrow-\operatorname{RCL}$

x 4 区 RCL H
ENTER
$\rightarrow$ SHOW

Display:

Description:
Selects Equation mode and starts the equation.

Terminates and displays the equation. Checksum and length.

It seems reasonable that either a tall, narrow box or a short, flat box could be formed having the desired volume. Because the taller box is preferred, larger initial estimates of the height are reasonable. However, heights greater than 20 cm are not physically possible because the metal sheet is only 40 cm wide. Initial estimates of 10 and 20 cm are therefore appropriate.
Keys:
Display:

$\nu=\langle 40-H) \times(20-H$
$V ?$
value
H=
15.0000

Leaves Equation mode. Stores lower and upper limit guesses.
Displays current equation.
Solves for $H$; prompts for $V$.

Stores 7500 in $V$; solves for H .

Now check the quality of this solution - that is, whether it returned an exact root - by looking at the value of the previous estimate of the root (in the Y -register) and the value of the equation at the root (in the Z-register).

Keys:

Display:
$15 \cdot 0006$
0.0000

Description:
This value from the Y -register is the estimate made just prior to the final result. Since it is the same as the solution, the solution is an exact root. This value from the Z-register shows the equation equals zero at the root.

The dimensions of the desired box are $50 \times 10 \times 15 \mathrm{~cm}$. If you ignored the upper limit on the height $(20 \mathrm{~cm})$ and used initial estimates of 30 and 40 cm , you would obtain a height of 42.0256 cm - a root that is physically meaningless. If you used small initial estimates such as 0 and 10 cm , you would obtain a height of 2.9774 cm - producing an undesirably short, flat box.

If you don't know what guesses to use, you can use a graph to help understand the behavior of the equation. Evaluate your equation for several values of the unknown. For each point on the graph, display the equation and press XEQ at the prompt for $x$ enter the $x$-coordinate, and then obtain the corresponding value of the equation, the $y$-coordinate. For the problem above, you would always set $V=7500$ and vary the value of $H$ to produce different values for the equation. Remember that the value for this equation is the difference between the left and right sides of the equation. The plot of the value of this equation looks like this.
$7500-(40-H)(20-H) 4 H$

## For More Information

This chapter gives you instructions for solving for unknowns or roots over a wide range of applications. Appendix D contains more detailed information about how the algorithm for SOLVE works, how to interpret results, what happens when no solution is found, and conditions that can cause incorrect results.

## 8

## Integrating Equations

Many problems in mathematics, science, and engineering require calculating the definite integral of a function. If the function is denoted by $f(x)$ and the interval of integration is $a$ to $b$, then the integral can be expressed mathematically as

$$
I=\int_{a}^{b} f(x) d x
$$

The quantity I can be interpreted geometrically as the area of a region bounded by the graph of the function $f(x)$, the $x$-axis, and the limits $x=a$ and $x=b$ (provided that $f(x)$ is nonnegative throughout the interval of integration).

The $\square$ operation ( $\int \mathrm{FN}$ ) integrates the current equation with respect to a specified variable ( $\int \mathrm{FN} \mathrm{d}_{-}$). The function may have more than one variable.
$\square$ works only with real numbers.

## Integrating Equations ( / FN)

## To integrate an equation:

1. If the equation that defines the integrand's function isn't stored in the equation list, key it in (see "Entering Equations into the Equation List" in chapter 6) and leave Equation mode. The equation usually contains just an expression.
2. Enter the limits of integration: key in the lower limit and press ENTER, then key in the upper limit.
3. Display the equation: Press EQN and, if necessary, scroll through the equation list (press $\uparrow$ or $\downarrow$ ) to display the desired equation.
4. Select the variable of integration: Press $\square \square$ variable. This starts the calculation.
$\square$ uses far more memory than any other operation in the calculator. If executing $\square$ causes a MEMORY FULL message, refer to appendix $B$.

You can halt a running integration calculation by pressing $C$ or $R / S$. However, no information about the integration is available until the calculation finishes normally.

The display format setting affects the level of accuracy assumed for your function and used for the result. The integration is more precise but takes much longer in the $\{\mathrm{PLL}\}$ and higher $\{\mathrm{FIX}\},\{\mathrm{SCI}\}$, and $\{E \mathrm{E} \in \mathrm{E}\}$ settings. The uncertainty of the result ends up in the Y -register, pushing the limits of integration up into the T - and Z-registers. For more information, see "Accuracy of Integration" later in this chapter.

## To integrate the same equation with different information:

If you use the same limits of integration, press $R T[R]$ move them into the $X$ - and Y -registers. Then start at step 3 in the above list. If you want to use different limits, begin at step 2.

To work another problem using a different equation, start over from step 1 with an equation that defines the integrand.

## Example: Bessel Function.

The Bessel function of the first kind of order 0 can be expressed as

$$
J_{0}(x)=\frac{1}{\pi} \int_{0}^{\pi} \cos (x \sin t) d t
$$

Find the Bessel function for $x$-values of 2 and 3 .
Enter the expression that defines the integrand's function:

$$
\cos (x \sin t)
$$

| 回 $\dagger$ | -0.2601 | The final result for J(3). |

## Example: Sine Integral.

Certain problems in communications theory (for example, pulse transmission through idealized networks) require calculating an integral (sometimes called the sine integral) of the form

$$
S_{i}(t)=\int_{0}^{t}\left(\frac{\sin x}{x}\right) d x
$$

Find $\operatorname{Si}(2)$.
Enter the expression that defines the integrand's function:

$$
\frac{\sin x}{x}
$$

If the calculator attempted to evaluate this function at $x=0$, the lower limit of integration, an error ( $\mathrm{DIVIDE} \mathrm{BY}{ }^{6}$ ) would result. However, the integration algorithm normally does not evaluate functions at either limit of integration, unless the endpoints of the interval of integration are extremely close together or the number of sample points is extremely large.

## Accuracy of Integration

Since the calculator cannot compute the value of an integral exactly, it approximates it. The accuracy of this approximation depends on the accuracy of the integrand's function itself, as calculated by your equation. This is affected by round-off error in the calculator and the accuracy of the empirical constants.

Integrals of functions with certain characteristics such as spikes or very rapid oscillations might be calculated inaccurately, but the likelihood is very small. The general characteristics of functions that can cause problems, as well as techniques for dealing with them, are discussed in appendix E .

## Specifying Accuracy

The display format's setting (FIX, SCI, ENG, or ALL) determines the precision of the integration calculation: the greater the number of digits displayed, the greater the precision of the calculated integral (and the greater the time required to calculate it). The fewer the number of digits displayed, the faster the calculation, but the calculator will presume that the function is accurate to the only number of digits specified in the display format.

To specify the accuracy of the integration, set the display format so that the display shows no more than the number of digits that you consider accurate in the integrand's values. This same level of accuracy and precision will be reflected in the result of integration.

If Fraction-display mode is on (flag 7 set), the accuracy is specified by the previous display format.

## Interpreting Accuracy

After calculating the integral, the calculator places the estimated uncertainty of that integral's result in the $Y$-register. Press $x \sim y$ to view the value of the uncertainty. For example, if the integral $\operatorname{Si}(2)$ is $1.6054 \pm 0.0002$, then 0.0002 is its uncertainty.

## Example: Specifying Accuracy.

With the display format set to SCl 2 , calculate the integral in the expression for Si(2) (from the previous example).

Keys: Display: Description:
DISPLAY \{SCI 2 1.61ED Sets scientific notation with two decimal places, specifying that the function is accurate to two decimal places.
Rt] Rt]
0. 0 00
2. 0 OED

Rolls down the limits of integration from the Z-and T-registers into the X -and Y-registers.
ERN
$\sin (x) \div x$
Displays the current Equation.

| H $\quad 1$ | IHTEGRAT ING $\begin{aligned} & \int= \\ & 1.61 E 0 \end{aligned}$ | The integral approximated to two decimal places. |
| :---: | :---: | :---: |
| $x$ | 1.61E-2 | The uncertainty of the approximation of the integral. |

The integral is $1.61 \pm 0.0161$. Since the uncertainty would not affect the approximation until its third decimal place, you can consider all the displayed digits in this approximation to be accurate.

If the uncertainty of an approximation is larger than what you choose to tolerate, you can increase the number of digits in the display format and repeat the integration (provided that $f(x)$ is still calculated accurately to the number of digits shown in the display), In general, the uncertainty of an integration calculation decreases by a factor of ten for each additional digit, specified in the display format.

## Example: Changing the Accuracy.

For the integral of $\operatorname{Si}(2)$ just calculated, specify that the result be accurate to four decimal places instead of only two.
Keys:
Display:

## Description:

| DISPLAY $\{\mathrm{SCI}\} 4$ | 1.6079E-2 | Specifies accuracy to four decimal places. The uncertainty from the last example is still in the display. |
| :---: | :---: | :---: |
| Rt Rt | $\begin{aligned} & 0.0000 \mathrm{E} 0 \\ & 2.0000 \mathrm{e} 0 \end{aligned}$ | Rolls down the limits of integration from the $Z$ - and T-registers into the $X$ - and Y-registers. |
| $\rightarrow$ EQN | SIN( S$) \div \mathrm{X}$ | Displays the current equation. |
| $\rightarrow \square \mathrm{X}$ | INTEORRTINE $\begin{aligned} & \int= \\ & 1.6054 \mathrm{ED} \end{aligned}$ | Calculates the result. |
| x $x \sim y$ | 1.6056E-4 | Note that the uncertainty is about $1 / 100$ as large as the uncertainty of the SCl 2 result calculated previously. |
| DISPLAY $\{\mathrm{FIX}$ ( 4 | 0.6062 | Restores FIX 4 format. |

This uncertainty indicates that the result might be correct to only three decimal places. In reality, this result is accurate to seven decimal places when compared with the actual value of this integral. Since the uncertainty of a result is calculated conservatively, the calculator's approximation in most cases is more accurate than its uncertainty indicates.

## For More Information

This chapter gives you instructions for using integration in the HP 33s over a wide range of applications. Appendix E contains more detailed information about how the algorithm for integration works, conditions that could cause incorrect results and conditions that prolong calculation time, and obtaining the current approximation to an integral.

## 9

## Operations with Complex Numbers

The HP 33s can use complex numbers in the form

$$
x+i y
$$

It has operations for complex arithmetic $(+,-, \times, \div)$, complex trigonometry (sin, cos, $\tan$ ), and the mathematics functions $-z, 1 / z, z_{1}{ }^{2}, \ln z$, and $e^{z}$. (where $z_{1}$ and $z_{2}$ are complex numbers).

## To enter a complex number:

1. Type the imaginary part.
2. Press ENTER.
3. Type the real part.

Complex numbers in the HP 33s are handled by entering each part (imaginary and real) of a complex number as a separate entry. To enter two complex numbers, you enter four separate numbers. To do a complex operation, press $\boxed{\rightarrow}$ CMPLX before the operator. For example, to do

$$
(2+i 4)+(3+i 5)
$$

press 4 ENTER 2 ENTER 5 ENTER 3 CMPLX + .
The result is $5+i 9$. (The first line is the imaginary and the second is the real part.)

## The Complex Stack

In RPN mode, the complex stack is really the regular memory stack split into two double registers for holding two complex numbers, $z_{1 x}+i z_{1 y}$ and $z_{2 x}+i z_{2 y}$ :

Real Stack

Complex Stack

Since the imaginary and real parts of a complex number are entered and stored separately, you can easily work with or alter either part by itself.

Complex input
$z$ or $z_{1}$ and $z_{2}$
Always enter the imaginary part (the $y$-part) of a number first. The real portion of the result $\left(z_{x}\right)$ is displayed on the second line; the imaginary portion $\left(z_{y}\right)$ is displayed on the first line. (For two-number operations, the first complex number, $z_{l}$, is replicated in the stack's $Z$ and $T$ registers.)

## Complex Operations

Use the complex operations as you do real operations, but precede the operator with CMPLX.

## To do an operation with one complex number:

1. Enter the complex number $z$, composed of $x+i y$, by keying in $y$ ENTER] $x$.
2. Select the complex function.

## Functions for One Complex Number, z

| To Calculate: | Press: |
| :---: | :---: |
| Change sign, -z | (6) CMPLX +/- |
| Inverse, 1/z | (5] CMPLX $1 / x$ |

| :---: | :---: | :---: |
| $\square 2$－ 2 －＋／－ENTER | $\begin{aligned} & -0.4000 \\ & -0.4000 \end{aligned}$ | Enters imaginary part of first complex number as a fraction． |
| 4 ENTER | 4．0606 | Enters real part of first |
|  | 4．0606 | complex number． |

| $\square 2$ - 3 + | -0.6667 | Enters imaginary part of |
| :---: | :---: | :---: |
|  | -0.6667 | second complex number a fraction. |
| 3 - CMPLX $x$ | -3.8667 | Completes entry of sec number and then multi the two complex numb Result is 11.7333 - i 3.8667. |
|  | 11.7333 |  |
|  |  |  |
| Evaluate $e^{z^{-2}}$, where $z=(1+i)$. Use CMPLX $\ln ^{x}$ to evaluate enter -2 as $-2+i 0$. |  |  |
| Keys: | Display: | Description: |
| 1 ENTER 1 ENTER |  | Intermediate result of$(1+i)^{-2}$ |
| 0 ENTER 2 + |  |  |
| CMPLX $y^{x}$ | -0.5000 |  |
|  | 6.6006 |  |
| (6) CMPLX $e^{x}$ | -0.4794 | Final result is |
|  | 0.8776 | 0.8776 - i 0.4794. |

## Using Complex Numbers in Polar Notation

Many applications use real numbers in polar form or polar notation. These forms use pairs of numbers, as do complex numbers, so you can do arithmetic with these numbers by using the complex operations. Since the HP 33s's complex operations work on numbers in rectangular form, convert polar form to rectangular form (using $\rightarrow y, x$ ) before executing the complex operation, then convert the result back to polar form.

$$
\begin{aligned}
& a+i b=r(\cos \theta+i \sin \theta)=r e i \theta \\
& =r \angle \theta \quad \text { (Polar or phase form) }
\end{aligned}
$$

## Example: Vector Addition.

Add the following three loads. You will first need to convert the polar coordinates to rectangular coordinates.

## Keys:

MODES \{DEG\}
62 ENTER $185 \rightarrow y, x$

143 ENTER $170 \rightarrow y, x$
(4] CMPLX +

261 ENTER $100 \rightarrow y, x$

Display:
Description:
Sets Degrees mode.
$16.3 .3453 \quad$ Enters $L_{1}$ and converts it to 86.8522 rectangular form.
102. 3086 Enters and converts L2.
$-135.7680$
265.6539 Adds vectors.
$-48.9158$
-98.7688 Enters and converts L3.
$-15.6434$

| (- CMPLX + | 166.8856 | Adds $L_{1}+L_{2}+L_{3}$. |
| :---: | :---: | :---: |
|  | -64.5592 |  |
| (6) $\rightarrow \theta, r$ | 111.1489 | Converts vector back to |
|  | 178.9372 | polar form; displays r, $\theta$ |

## 10

## Base Conversions and Arithmetic

The BASE menu ( $\boxed{\boxed{l}}$ BASE ) lets you change the number base used for entering numbers and other operations (including programming). Changing bases also converts the displayed number to the new base.

BASE Menu

| Menu label | Description |
| :---: | :---: |
| \{DEC, | Decimal mode. No annunciator. Converts numbers to base 10. Numbers have integer and fractional parts. |
| \{HEX\} | Hexadecimal mode. HEX annunciator on. Converts numbers to base 16; uses integers only. The top-row keys become digits $A$ through $\mp$. |
| \{OCT\} | Octal mode. OCT annunciator on. Converts numbers to base 8; uses integers only. The 8, 9, and unshifted top-row keys are inactive. |
| \{EIN\} | Binary mode. BIN annunciator on. Converts numbers to base 2; uses integers only. Digit keys other than 0 and 1, and the unshifted top-row functions are inactive. If a number is longer than 12 digits, then the $\boxed{\square}$ and $\square$ keys are active for viewing windows. (See "Windows for Long Binary Numbers" later in this chapter.) |

## Examples: Converting the Base of a Number.

The following keystrokes do various base conversions.
Convert 125.9910 to hexadecimal, octal, and binary numbers.

| Keys: | Display: | Description: |
| :--- | :--- | :--- |
| 125.99 BASE | 70 | Converts just the integer part <br> $(125)$ of the decimal number to <br> base 16 and displays this value. |
| $\{H E X\}$ | 175 | Base 8. |

(6) BASE $\{\mathrm{BI} \mathrm{I}$ \} $\}$
(G) BASE \{DEC\} 125.9906

1111101 Base 2.
Restores base 10; the original decimal value has been preserved, including its fractional part.

Convert $24 \mathrm{FF}_{16}$ to binary base. The binary number will be more than 12 digits (the maximum display) long.

Keys:
( - BASE $\{\mathrm{HE}$ K $\}$ 24FF
( - BASE $\{\mathrm{BI} \mathrm{H}\}$
 (G) BASE $\{D E C\}$

Display:
24FF
010011111111 The entire binary number does not fit. The annunciator indicates
that the number continues to the fit. The annunciator indicates
that the number continues to the left.
10 Displays the rest of the number. The full number is 100100111111112 .
010011111111 Displays the first 12 digits again.

## Description:

Use the $x^{2}$ key to type " $F$ ". Restores base 10.

## Arithmetic in Bases 2, 8, and 16

You can perform arithmetic operations using $\pm, \boxed{\square}, \boxed{x}$, and $\div$ in any base. The only function keys that are actually deactivated outside of Decimal mode are $e^{x}, L^{2}, y^{x}, 1 / x, \Sigma^{+}$, and $x^{2}$. However, you should realize that most operations other than arithmetic will not produce meaningful results since the fractional parts of numbers are truncated.

Arithmetic in bases 2, 8, and 16 is in 2's complement form and uses integers only:

- If a number has a fractional part, only the integer part is used for an arithmetic calculation.
- The result of an operation is always an integer (any fractional portion is truncated).

Whereas conversions change only the displayed number and not the number in the X -register, arithmetic does alter the number in the X -register.

If the result of an operation cannot be represented in 36 bits，the display shows OVERFLOW and then shows the largest positive or negative number possible．

## Example：

Here are some examples of arithmetic in Hexadecimal，Octal，and Binary modes：

$$
\begin{array}{ccc} 
& 12 \mathrm{~F}_{16}+{\mathrm{E} 9 \mathrm{~A}_{16}}=? \\
\text { Keys: } \quad \text { Display: } & \\
& \text { Description: }
\end{array}
$$

（⿴囗 BASE \｛HEX\}
12 F ENTER E9A +

7760 ENTER $4326 \square$

$$
7760_{8}-4326_{8}=?
$$

7711 Sets base 8；OCT annunciator on．Converts displayed number to octal．
3432 Result．

$$
1008 \div 58=?
$$

100 ENTER $5 \div$
14 Integer part of result．

$$
5 A O_{16}+1001100_{2}=?
$$

Sets base 16；HEX annunciator on． Result．

## Description：

## Description：

 Resul．（⿴囗 BASE \｛HEX\} 5AO
（⿴囗大 BASE \｛BIN\} 1001100

（⿴囗 BASE \｛DEC\}

5月0＿Set base 16；HEX annunciator on．
1061100＿Changes to base 2；BIN annunciator on．This
terminates digit entry，so no ENTER］is needed between the numbers．
10111101100 Result in binary base．
5EC Result in hexadecimal base．
1，516．0000 Restores decimal base．

## The Representation of Numbers

Although the display of a number is converted when the base is changed, its stored form is not modified, so decimal numbers are not truncated - until they are used in arithmetic calculations.

When a number appears in hexadecimal, octal, or binary base, it is shown as a right-justified integer with up to 36 bits ( 12 octal digits or 9 hexadecimal digits). Leading zeros are not displayed, but they are important because they indicate a positive number. For example, the binary representation of 12510 is displayed as:

## 1111101

which is the same as these 36 digits:
000000000000000000000000000001111101

## Negative Numbers

The leftmost (most significant or "highest") bit of a number's binary representation is the sign bit; it is set (1) for negative numbers. If there are (undisplayed) leading zeros, then the sign bit is 0 (positive). A negative number is the 2 's complement of its positive binary number.

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| 546 BASE $\{\mathrm{HEX}\}$ | 222 | Enters a positive, decimal number; then converts it to hexadecimal. |
| +/- | FFFFFFDLE | 2's complement (sign changed). |
| (6) BASE $\{\mathrm{BIF} \stackrel{\text { H }}{ }$ \} | 110111011110 | Binary version; indicates more digits. |
| $\longleftarrow \square$ | 111111111111 | Displays the leftmost window; the number is negative since the highest bit is 1 . |
| (6) BASE $\{\mathrm{DEC}\}$ | $-546.0060$ | Negative decimal number. |

## Range of Numbers

The 36 -bit word size determines the range of numbers that can be represented in hexadecimal ( 9 digits), octal ( 12 digits), and binary bases ( 36 digits), and the range of decimal numbers ( 11 digits) that can be converted to these other bases.

## Range of Numbers for Base Conversions

| Base | Positive Integer <br> of Largest Magnitude | Negative Integer <br> of Largest Magnitude |
| :--- | :--- | :--- |
| Hexadecimal | $7 F F F F F F F F$ | 800000000 |
| Octal | 377777777777 | 400000000000 |
| Binary | 01111111111111111111 | 1000000000000000000000 |
|  | 1111111111111 | 00000000000000 |
| Decimal | $34,359,738,367$ | $-34,359,738,368$ |

When you key in numbers, the calculator will not accept more than the maximum number of digits for each base. For example, if you attempt to key in a 10-digit hexadecimal number, digit entry halts and the $\mathbf{\Delta}$ annunciator appears.

If a number entered in decimal base is outside the range given above, then it produces the message TOO BIG in the other base modes. In RPN mode, the original decimal value of any too-big number is used in calculations. Any operation that results in a number outside the range given above causes OVERFLOW to be briefly displayed. The display then shows the largest positive or negative integer representable in the current base. In ALG mode, any operation (except +/- in the entry line but not in a variable prompt) using TOO BIG displays the $\mathbf{A}$ annunciator.

## Windows for Long Binary Numbers

The longest binary number can have 36 digits - three times as many digits as fit in the display. Each 12-digit display of a long number is called a window.

36 - bit number

11111111111106060606060111111111111

When a binary number is larger than the 12 digits, the $\boldsymbol{m} \boldsymbol{r}$ annunciator (or both) appears, indicating in which direction the additional digits lie. Press the indicated key ( $\sqsubset$ or $\square$ ) to view the obscured window.

## Statistical Operations

The statistics menus in the HP 33s provide functions to statistically analyze a set of one－or two－variable data：
－Mean，sample and population standard deviations．
－Linear regression and linear estimation（ $\hat{x}$ and $\hat{y}$ ）．
－Weighted mean（ $x$ weighted by $y$ ）．
－Summation statistics：$n, \Sigma x, \Sigma y, \Sigma x^{2}, \Sigma y^{2}$ ，and $\Sigma x y$ ．

## Entering Statistical Data

One－and two－variable statistical data are entered（or deleted）in similar fashion using the $\Sigma+$（or $\boxed{\Omega-}$ ）key．Data values are accumulated as summation statistics in six statistics registers（28 through 33），whose names are displayed in the SUMS menu．（Press $⿴ 囗 十 \Delta$ SUMS and see $n \Sigma \times \Sigma y \Sigma x^{2} \Sigma y^{2} \Sigma \times y$ ）．

Note
Always clear the statistics registers before entering a new set of statistical data（press 国 CLEAR $\{\bar{Z}\}$ ）．

## Entering One-Variable Data

1. Press ( 5 CLEAR $\{\Sigma\}$ to clear existing statistical data.
2. Key in each $x$-value and press $\Sigma+$.
3. The display shows $n$, the number of statistical data values now accumulated.

Pressing $\Sigma+$ actually enters two variables into the statistics registers because the value already in the Y-register is accumulated as the $y$-value. For this reason, the calculator will perform linear regression and show you values based on $y$ even when you have entered only $x$-data - or even if you have entered an unequal number of $x$-and $y$-values. No error occurs, but the results are obviously not meaningful.

To recall a value to the display immediately after it has been entered, press $\quad \mathbf{\square}$ LAST $x$.

## Entering Two-Variable Data

In RPN mode, when your data consist of two variables, $x$ is the independent variable and $y$ is the dependent variable. Remember to enter an $(x, y)$ pair in reverse order ( $y$ ENTER $x$ ) so that $y$ ends up in the Y-register and $X$ in the X-register.

1. Press 6 CLEAR $\{\Sigma\}$ to clear existing statistical data.
2. Key in the $y$-value first and press ENTER.
3. Key in the corresponding $x$-value and press $\Sigma+$.
4. The display shows $n$, the number of statistical data pairs you have accumulated.
5. Continue entering $x, y$-pairs. $n$ is updated with each entry.

To recall an $x$-value to the display immediately after it has been entered, press (4) LAST $x$.

## Correcting Errors in Data Entry

If you make a mistake when entering statistical data, delete the incorrect data and add the correct data. Even if only one value of an $x, y$-pair is incorrect, you must delete and reenter both values.

To correct statistical data:

1．Reenter the incorrect data，but instead of pressing $\Sigma+$ ，press $\boxed{\boxed{ }} \boxed{\square}$ ．This deletes the value（s）and decrements $n$ ．
2．Enter the correct value（s）using $\Sigma+$ ．
If the incorrect values were the ones just entered，press $⿴ 囗$ LASTx to retrieve them，then press $\Sigma \Sigma$ to delete them．（The incorrect $y$－value was still in the Y －register，and its x －value was saved in the LAST X register．）

## Example：

Key in the $x, y$－values on the left，then make the corrections shown on the right：

| Initial $\mathbf{x}, \mathbf{y}$ | Corrected $\mathbf{x}, \mathbf{y}$ |
| :---: | :---: |
| 20,4 | 20,5 |
| 400,6 | 40,6 |

Keys：
（国）CLEAR $\{\Sigma\}$

| 4 ENTER $20 \Sigma+$ | 4.0000 |
| :--- | :--- |
|  | 1.0000 |
| 6 ENTER $400 \Sigma+\Sigma$ | 6.0000 |
|  | 2.0000 |

| （－7ASTx | 6.0000 |
| :---: | :---: |
|  | 400.0000 |
| （2） | 6.0006 |
|  | 1.0006 |
| 6 ENTER 40 E＋ | 6.0000 |
|  | 2.0000 |
| 4 ENTER 20 囫 | 4．0000 |
|  | 1．0006 |
| 5 ENTER 20 L＋ | 5.0000 |
|  | 2.0000 |

## Description：

Clears existing statistical data．
Enters the first new data pair．
Display shows $n$ ，the number of data pairs you entered．
Brings back last $x$－value． Last $y$ is still in Y －register． Deletes the last data pair．

Reenters the last data pair．
Deletes the first data pair．
Reenters the first data pair． There is still a total of two data pairs in the statistics registers．

## Statistical Calculations

Once you have entered your data, you can use the functions in the statistics menus.

## Statistics Menus

| Menu | Key | Description |
| :---: | :---: | :---: |
| L.R. | $\rightarrow$ L.R. | The linear-regression menu: linear estimation $\{\hat{X}\}\{\hat{Y}\}$ and curve-fitting $\{r\}\{m\}$ $\{\mathrm{b}\}$. See "Linear Regression" later in this chapter. |
| $\bar{x}, \bar{y}$ | $\vec{x}, \bar{x}, \bar{y}$ | The mean menu: $\{\bar{x}\}\{\bar{y}\}\{\bar{x} \mu\}$. See "Mean" below. |
| $s, \sigma$ | $\leftrightarrow S$ | The standard-deviation menu: $\{\Xi \times\}\{\Xi \vartheta\}$ $\{\sigma \times\}\left\{\sigma^{*}\right\}$. See "Sample Standard Deviation" and "Population Standard Deviation" later in this chapter. |
| SUMS | ¢ SUMS | The summation menu: $\{\Gamma\}\{\Sigma \times\}$ \{ $\Sigma>\}\left\{\Sigma \times^{2}\right\}$ $\left\{\Sigma y^{2}\right\}\{\Sigma \times \overline{\}}$. See "Summation Statistics" later in this chapter. |

## Mean

Mean is the arithmetic average of a group of numbers.

- Press $\boldsymbol{\square} \overline{\bar{x}} \overline{\bar{y}}\{\bar{X}\}$ for the mean of the $x$-values.
- Press $\boldsymbol{\square} \bar{x}_{\bar{x}}^{\bar{y}}\{\bar{y}\}$ for the mean of the $y$-values.
- Press $\boldsymbol{\square} \overline{x_{\bar{y}}}\{\overline{\mathrm{X}} \boldsymbol{\mu}\}$ for the weighted mean of the $x$-values using the $y$-values as weights or frequencies. The weights can be integers or non-integers.

## Example: Mean (One Variable).

Production supervisor May Kitt wants to determine the average time that a certain process takes. She randomly picks six people, observes each one as he or she carries out the process, and records the time required (in minutes):

| 15.5 | 9.25 | 10.0 |
| :--- | :--- | :--- |
| 12.5 | 12.0 | 8.5 |

Calculate the mean of the times．（Treat all data as $x$－values．）

| Keys： | Display： | Description： |
| :---: | :---: | :---: |
| （⿴囗 CLEAR $\{\Sigma$ \} |  | Clears the statistics registers． |
| $15.5{ }^{\Sigma+}$ | 1.0000 | Enters the first time． |
| $\begin{aligned} & 9.25 \text { 汭 } 10 \text { 汭 } 12.5 \text { 汭 } \\ & 12\left[\Sigma+8.5 \Sigma \Sigma^{\Sigma+}\right. \end{aligned}$ | 6.00000 | Enters the remaining data； six data points accumulated． |
| $\square \sqrt{\square} \bar{x}, \bar{y}$ \｛ $\bar{X}\}$ | $\frac{\bar{x} \bar{x} \bar{x}}{11.2917}$ | Calculates the mean time to complete the process． |

## Example：Weighted Mean（Two Variables）．

A manufacturing company purchases a certain part four times a year．Last year＇s purchases were：

| Price per Part（x） | $\$ 4.25$ | $\$ 4.60$ | $\$ 4.70$ | $\$ 4.10$ |
| :--- | :--- | :--- | :--- | :--- |
| Number of Parts $(\mathbf{y})$ | 250 | 800 | 900 | 1000 |

Find the average price（weighted for the purchase quantity）for this part． Remember to enter $y$ ，the weight（frequency），before $x$ ，the price．

| Keys： | Display： | Description： |
| :---: | :---: | :---: |
|  |  | Clears the statistics registers． |
| 250 ENTER］ 4.25 इ＋ |  | Enters data；displays $n$ ． |
| 800 ENTER 4.6 E＋ |  |  |
| 900 ENTER $4.7{ }^{\text {E＋}}$ | 900.00000 |  |
|  | 3.0000 |  |
| 1000 ENTER 4.1 ＋ | $\begin{aligned} & 1,000 \cdot 0000 \\ & 4 \cdot 0000 \end{aligned}$ | Four data pairs accumulated． |
|  | $\bar{X} \bar{Y} \bar{x} \mu$ | Calculates the mean price weighted for the quantity purchased． |
|  | 4.4314 |  |
|  |  |  |

## Sample Standard Deviation

Sample standard deviation is a measure of how dispersed the data values are about the mean sample standard deviation assumes the data is a sampling of a larger，complete set of data，and is calculated using $n-1$ as a divisor．
－Press $\rightarrow S, \sigma\{\xi \times\}$ for the standard deviation of $x$－values．
－Press $S, \sigma\{\xi \vartheta\}$ for the standard deviation of $y$－values．
The $\left\{\sigma^{\times}\right\}$and $\left\{\sigma^{Y}\right\}$ keys in this menu are described in the next section，＂Population Standard Deviation．＂

## Example：Sample Standard Deviation．

Using the same process－times as in the above＂mean＂example，May Kitt now wants to determine the standard deviation time（ $s_{x}$ ）of the process：
15.5
9.25
10.0
12.5
12.0
8.5

Calculate the standard deviation of the times．（Treat all the data as $x$－values．）
（⿴囗⿰丨丨⿱一⿴⿻儿口一己 CLEAR $\{\Sigma\}$
$15.5 \quad \Sigma+$

$12 \boxed{\Sigma+} 8.5 \Sigma^{\Sigma+}$

Keys：
Display：Description：

Clears the statistics registers．
1．00000 Enters the first time．
Enters the remaining data；six data points entered．
Calculates the standard deviation time．

## Population Standard Deviation

Population standard deviation is a measure of how dispersed the data values are about the mean．Population standard deviation assumes the data constitutes the complete set of data，and is calculated using $n$ as a divisor．
－Press $\square S, \sigma\{\sigma \times\}$ for the population standard deviation of the $x$－values．
－Press $\rightarrow S, \sigma\left\{\sigma^{*}\right\}$ for the population standard deviation of the $y$－values．

## Example: Population Standard Deviation.

Grandma Hinkle has four grown sons with heights of $170,173,174$, and 180 cm . Find the population standard deviation of their heights.
Keys: Display: Description:
(G] CLEAR $\{\Sigma\}$
170 汭 173 汭
174 [ $\Sigma+180$ [ $\mathrm{\Sigma+}$
$\rightarrow$ S,$\sigma\{\sigma \times\}$

Clears the statistics registers. Enters data. Four data points accumulated.
Calculates the population standard deviation.

## Linear Regression

Linear regression, L.R. (also called linear estimation) is a statistical method for finding a straight line that best fits a set of $x, y$-data.

Note | To avoid a STAT ERROR message, enter your data before |
| :--- |
| executing any of the functions in the L.R. menu. |

| L.R. (Linear Regression) Menu |
| :--- | :--- |

| $\{\hat{X}\}$ | Description |
| :--- | :--- |

$\{\hat{Y}\}$
$\{r\}$
$\{\mathrm{m}\}$
－To find an estimated value for $x$（or $y$ ），key in a given hypothetical value for $y$ （or $x$ ），then press L．R．$\{\hat{X}\}$（or L．R．$\{\hat{y}\}$ ）．
－To find the values that define the line that best fits your data，press $⿴ 囗 \rightarrow$ L．R． followed by $\{r\}$ ，$\{\boldsymbol{m}\}$ ，or $\{\mathbf{b}\}$ ．

## Example：Curve Fitting．

The yield of a new variety of rice depends on its rate of fertilization with nitrogen． For the following data，determine the linear relationship：the correlation coefficient， the slope，and the $y$－intercept．

| X，Nitrogen Applied <br> （kg per hectare） | 0.00 | 20.00 | 40.00 | 60.00 | 80.00 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Y，Grain Yield <br> （metric tons per hectare） | 4.63 | 5.78 | 6.61 | 7.21 | 7.78 |

Keys：
（⿴囗 CLEAR $\{\Sigma\}$
4.63 ENTER］ $0{ }^{+}$
5.78 ENTER 20 地

6．61 ENTER $40 \mathrm{\Sigma+}$
7.21 ENTER $60 \boxed{\Sigma+}$

7.7800

70
$\hat{x}-\hat{y} r \mathrm{mb}$
7.5615

Description:
Enters hypothetical $x$-value.
The predicted yield in tons per hectare.

## Limitations on Precision of Data

Since the calculator uses finite precision ( 12 to 15 digits), it follows that there are limitations to calculations due to rounding. Here are two examples:

## Normalizing Close, Large Numbers

The calculator might be unable to correctly calculate the standard deviation and linear regression for a variable whose data values differ by a relatively small amount. To avoid this, normalize the data by entering each value as the difference from one central value (such as the mean). For normalized $x$-values, this difference must then be added back to the calculation of $\bar{x}$ and $\hat{x}$, and $\hat{y}$ and $b$ must also be adjusted. For example, if your $x$-values were 7776999,7777000 , and 7777001 , you should enter the data as $-1,0$, and 1 ; then add 7777000 back to $\bar{x}$ and $\hat{x}$. For b, add back $7777000 \times m$. To calculate $\hat{y}$, be sure to supply an $x$-value that is less 7777000 .

Similar inaccuracies can result if your $x$ and $y$ values have greatly different magnitudes. Again, scaling the data can avoid this problem.

## Effect of Deleted Data

Executing 国 $\Sigma^{-}$does not delete any rounding errors that might have been generated in the statistics registers by the original data values. This difference is not serious unless the incorrect data have a magnitude that is enormous compared with the correct data; in such a case, it would be wise to clear and reenter all the data.

## Summation Values and the Statistics Registers

The statistics registers are six unique locations in memory that store the accumulation of the six summation values.

## Summation Statistics

Pressing SUMS gives you access to the contents of the statistics registers:

- Press $\{n\}$ to recall the number of accumulated data sets.
- Press $\{x\}$ to recall the sum of the $x$-values.
- Press $\{y\}$ to recall the sum of the $y$-values.
- Press $\left\{\Sigma \times^{2}\right\},\left\{\Sigma y^{2}\right\}$, and $\{\Sigma \times \nu\}$ to recall the sums of the squares and the sum of the products of the $x$ and $y$ - values that are of interest when performing other statistical calculations in addition to those provided by the calculator.

If you＇ve entered statistical data，you can see the contents of the statistics registers． Press $⿴ 囗$ MEM $\{V \mathrm{FR}\}$ ，then use $\uparrow$ and $\downarrow$ to view the statistics registers．

## Example：Viewing the Statistics Registers．

Use $\Sigma+$ to store data pairs $(1,2)$ and $(3,4)$ in the statistics registers．Then view the stored statistical values．
Keys：
Display：

## Description：

（⿴囗 CLEAR $\{\Sigma\}$
2 ENTER］ $1 \Sigma^{+}$

4 ENTER 3 E＋4．0000
2．0000
［⿴囗 MEM $\{$ URR $\} \quad n=$
2．0006
इxy＝
14．0000
$\Sigma y^{2}=$
20．0000
$\Sigma x^{2}=$
10．0000
$\Sigma y=$
6.0006

E×＝
4.0006

4．0000
2．0000
C

Clears the statistics registers．
Stores the first data pair $(1,2)$ ．

Stores the second data pair $(3,4)$ ．

Displays VAR catalog and views $n$ register．
Views Exy register．
Views $\Sigma y^{2}$ register．
Views $\Sigma x^{2}$ register．

Views $\Sigma y$ register．

Views $\Sigma x$ register．
Leaves VAR catalog．

## The Statistics Registers in Calculator Memory

The memory space for the statistics registers is automatically allocated（if it doesn＇$\dagger$ already exist）when you press $\Sigma+$ or $\Sigma-$ ．The registers are deleted and the memory deallocated when you execute［⿴囗 CLEAR $\{\Sigma\}$ ．

## Access to the Statistics Registers

The statistics register assignments in the HP 33s are shown in the following table．

## Statistics Registers

| Register | Number | Description |
| :---: | :---: | :--- |
| $n$ | 28 | Number of accumulated data pairs. |
| $\Sigma x$ | 29 | Sum of accumulated $x$-values. |
| $\Sigma y$ | 30 | Sum of accumulated $y$-values. |
| $\Sigma x^{2}$ | 31 | Sum of squares of accumulated $x$-values. |
| $\Sigma y^{2}$ | 32 | Sum of squares of accumulated $y$-values. |
| $\Sigma x y$ | 33 | Sum of products of accumulated $x$-and <br> $y$-values. |

You can load a statistics register with a summation by storing the number (28 through 33) of the register you want in $i$ (number STO ( $i$ ) and then storing the summation (value STO (ii). Similarly, you can press VIEW (i) to view a register value - the display is labeled with the register name. The SUMS menu contains functions for recalling the register values. See "Indirectly Addressing Variables and Labels" in chapter 13 for more information.

## Part 2

## Programming

## 12

## Simple Programming

Part 1 of this manual introduced you to functions and operations that you can use manually, that is, by pressing a key for each individual operation. And you saw how you can use equations to repeat calculations without doing all of the keystrokes each time.

In part 2, you'll learn how you can use programs for repetitive calculations calculations that may involve more input or output control or more intricate logic. A program lets you repeat operations and calculations in the precise manner you want.

In this chapter you will learn how to program a series of operations. In the next chapter, "Programming Techniques," you will learn about subroutines and conditional instructions.

## Example: A Simple Program.

To find the area of a circle with a radius of 5 , you would use the
formula $A=\pi r^{2}$ and press
RPN mode: $5 x^{2} \rightarrow \pi x$
ALG mode: $5 x^{2}$ 区 $\rightarrow \pi$ ENTER
to get the result for this circle, 78.5398 .
But what if you wanted to find the area of many different circles?
Rather than repeat the given keystrokes each time (varying only the " 5 " for the different radii), you can put the repeatable keystrokes into a program:

| RPN mode | ALG mode |
| :--- | :--- |
| $00001 \times 2$ | $00001 \times 2$ |
| $00002 \pi$ | $00002 \times$ |
| $00003 \times$ | $00003 \pi$ |
|  | 00004 EHTER |

This very simple program assumes that the value for the radius is in the X - register (the display) when the program starts to run. It computes the area and leaves it in the X -register.

In RPN mode, to enter this program into program memory, do the following:
Keys:
(In RPN mode)
Display:
Description:
(G) CLEAR $\{\mathrm{PLL}\}\{\mathrm{Y}\}$
(4) PRGM

Clears memory.
Activates Program-entry mode
(PRGM annunciator on).
(G) GTO $\cdot \bullet$
$x^{2}$
$00001 x^{2} \quad(\text { Radius })^{2}$
(H) $\pi$ $00002 \pi$
$x$
(G) PRGM

Area $=\pi x^{2}$
Exits Program-entry mode.

Try running this program to find the area of a circle with a radius of 5:
Keys:
Display:
Description: (In RPN mode)
(G] GTO $\bullet \bullet$

5 R/S
78.5398

This sets the program to its beginning.
The answer!
We will continue using the above program for the area of a circle to illustrate programming concepts and methods.

## 12-2 Simple Programming

## Designing a Program

The following topics show what instructions you can put in a program. What you put in a program affects how it appears when you view it and how it works when you run it.

## Selecting a Mode

Programs created and saved in RPN mode can only be edited and executed in RPN mode, and programs or steps created and saved in ALG mode can only be edited and executed in ALG mode. You can ensure that your program executes in the correct mode by making RPN or ALG the first instruction in the program.

## Program Boundaries (LBL and RTN)

If you want more than one program stored in program memory, then a program needs a label to mark its beginning (such as F061 LBL F) and a return to mark its end (such as F0065 RTH).

Notice that the line numbers acquire an B to match their label.

## Program Labels

Programs and segments of programs (called routines) should start with a label. To record a label, press:

## ( - LBL letter-key

The label is a single letter from A through Z. The letter keys are used as they are for variables (as discussed in chapter 3). You cannot assign the same label more than once (this causes the message DUFL IC:AT. LEL), but a label can use the same letter that a variable uses.

It is possible to have one program (the top one) in memory without any label. However, adjacent programs need a label between them to keep them distinct.

## Program Returns

Programs and subroutines should end with a return instruction. The keystrokes are:
$\rightarrow$ RTN

When a program finishes running, the last RTN instruction returns the program pointer to FREM TOF, the top of program memory.

## Using RPN, ALG and Equations in Programs

You can calculate in programs the same ways you calculate on the keyboard:
■ Using RPN operations (which work with the stack, as explained in chapter 2).

- Using ALG operations (as explained in appendix C).
- Using equations (as explained in chapter 6).

The previous example used a series of RPN operations to calculate the area of the circle. Instead, you could have used an equation in the program. (An example follows later in this chapter.) Many programs are a combination of RPN and equations, using the strengths of both.

## Strengths of RPN Operations

Use less memory.
Execute a bit faster.

## Strengths of Equations and ALG Operations

Easier to write and read.
Can automatically prompt.

When a program executes a line containing an equation, the equation is evaluated in the same way that XEQ evaluates an equation in the equation list. For program evaluation, "=" in an equation is essentially treated as "-". (There's no programmable equivalent to ENTER for an assignment equation - other than writing the equation as an expression, then using STO to store the value in a variable.)

For both types of calculations, you can include RPN instructions to control input, output, and program flow.

## Data Input and Output

For programs that need more than one input or return more than one output, you can decide how you want the program to enter and return information.

For input, you can prompt for a variable with the INPUT instruction, you can get an equation to prompt for its variables, or you can take values entered in advance onto the stack.

For output，you can display a variable with the VIEW instruction，you can display a message derived from an equation，or you can leave unmarked values on the stack．

These are covered later in this chapter under＂Entering and Displaying Data．＂

## Entering a Program

Pressing ©RGM toggles the calculator into and out of Program－entry mode－turns the PRGM annunciator on and off．Keystrokes in Program－entry mode are stored as program lines in memory．Each instruction or number occupies one program line，and there is no limit（other than available memory）on the number of lines in a program．

## To enter a program into memory：

1．Press $⿴ 囗$ PRGM to activate Program－entry mode．
2．Press $⿴ 囗 \square \square$ to display PREM TOF．This sets the program pointer to a known spot，before any other programs．As you enter program lines，they are inserted before all other program lines．

If you don＇t need any other programs that might be in memory，clear program memory by pressing 国 CLEAR \｛PGM\}. To confirm that you want all programs deleted，press $\{\mathrm{Y}\}$ after the message CLR FGMS？ Y N ．
3．Give the program a label－a single letter，$A$ through $Z$ ．Press $⿴ 囗 \mathbb{Q B L}$ letter． Choose a letter that will remind you of the program，such as＂A＂for＂area．＂

If the message DUPLICAT LEBL is displayed，use a different lefter．You can clear the existing program instead－press $⿴ 囗$ MEM $\{\mathrm{FCM}\}$ ，use $\uparrow$ or $\downarrow$ to find the label，and press $⿴ 囗 \rightarrow$ CLEAR］and［C．
4．To record calculator operations as program instructions，press the same keys you would to do an operation manually．Remember that many functions don＇t appear on the keyboard but must be accessed using menus．

[^2]5. End the program with a return instruction, which sets the program pointer back to PREM TOF after the program runs. Press $\rightarrow$ RTN.
6. Press ( C (or $\mathbf{\square R G}$ ) to cancel program entry.

Numbers in program lines are stored as precisely as you entered them, and they're displayed using ALL or SCI format. (If a long number is shortened in the display, press SHOW to view all digits.)

## To enter an equation in a program line:

1. Press EQN to activate Equation-entry mode. The EQN annunciator turns on.
2. Enter the equation as you would in the equation list. See chapter 6 for details. Use $\longleftarrow$ to correct errors as you type.
3. Press ENTER to terminate the equation and display its left end. (The equation does not become part of the equation list.)

After you've entered an equation, you can press SHOW to see its checksum and length. Hold the SHOW key to keep the values in the display.

For a long equation, the $\Rightarrow$ and $\leqslant$ annunciators show that scrolling is active for this program line. You can use $\square$ and $\longleftarrow$ to scroll the display.

## Keys That Clear

Note these special conditions during program entry:

- C] always cancels program entry. It never clears a number to zero.
- If the program line doesn't contain an equation, $\leftrightarrows$ deletes the current program line. It backspaces if a digit is being entered ("_" cursor present).
- If the program line contains an equation, $\leftarrow$ begins editing the equation. It deletes the rightmost function or variable if an equation is being entered ("■" cursor present).
- $\quad$ CLEAR \{EQㅂ\}$\}$ deletes a program line if it contains an equation.
- To program a function to clear the $X$-register, use $\square$ CLEAR $\{\times\}$.

## 12-6 Simple Programming

## Function Names in Programs

The name of a function that is used in a program line is not necessarily the same as the function's name on its key, in its menu, or in an equation. The name that is used in a program is usually a fuller abbreviation than that which can fit on a key or in a menu. This fuller name appears briefly in the display whenever you execute a function - as long as you hold down the key, the name is displayed.

## Example: Entering a Labeled Program.

The following keystrokes delete the previous program for the area of a circle and enter a new one that includes a label and a return instruction. If you make a mistake during entry, press $\leftrightarrows$ to delete the current program line, then reenter the line correctly.

## Keys: (In RPN mode)

| PRGM |  | Activates Program-entry <br> mode (PRGM on). |
| :--- | :--- | :--- |
| Clears all of program |  |  |

A different checksum means the program was not entered exactly as given here.

## Example：Entering a Program with an Equation．

The following program calculates the area of a circle using an equation，rather than using RPN operations like the previous program．
Keys： （In RPN mode）

Display：
Description：

| （回 PRGM $⿴ 囗$ | PREM TOP | Activates Program－entry |
| :---: | :---: | :---: |
| GTO $\cdot \square$ |  | mode；sets pointer to top of memory． |
| （LBL） E | E0001 LELE | Labels this program routine E（for ＂equation＂）． |
| STO．R | E0002 ST0R | Stores radius in variable R． |
| $\begin{aligned} & \square \text { EQN } ⿴ 囗 \pi \\ & \times \operatorname{RCL} R \end{aligned}$ |  | Selects Equation－entry mode；enters the |
| ${ }^{\boldsymbol{x} x} 2$ ENTER | E0063 $\pi \times \mathrm{R} \times 2$ | equation；returns to Program－entry mode． |
| B SHOW | $\begin{aligned} & C K=7 E \cdot 5 B \\ & L N=5 \end{aligned}$ |  |
| ［ RTN | E0064 RTN | Ends the program． |
| （⿴囗 MEM \｛PCM $\}$ | $\begin{aligned} & \text { LEL E } \\ & \text { LH } \mathrm{H}=17 \end{aligned}$ | Displays label E and the length of the program in bytes． |
| B SHOW | $\begin{aligned} & C K=4 \mathrm{CDF} \\ & \mathrm{LH}=17 \end{aligned}$ | Checksum and length of equation． |
| C C |  | Cancels program entry． |

## 12－8 Simple Programming

## Running a Program

To run or execute a program，program entry cannot be active（no program－line numbers displayed；PRGM off）．Pressing will cancel Program－entry mode．

## Executing a Program（XEQ）

Press XEQ label to execute the program labeled with that letter．If there is only one program in memory，you can also execute it by pressing 国 GTO $\cdot \square$ R／S（run／stop）．

If necessary，enter the data before executing the program．

## Example：

Run the programs labeled A and E to find the areas of three different circles with radii of $5,2.5$ ，and $2 \pi$ ．Remember to enter the radius before executing $A$ or $E$ ．
Keys：
Display：
Description： （In RPN mode）

| 5 XEQ A | RUHEINE | Enters the radius，then starts |
| :---: | :---: | :---: |
|  | 78.5398 | program A．The resulting area is displayed． |
| 2.5 XEQ E | 19.6350 | Calculates area of the second circle using program E ． |
| 2 国 区 XEQ |  | Calculates area of the third |
| A | 124．0251 | circle． |

## Testing a Program

If you know there is an error in a program，but are not sure where the error is，then a good way to test the program is by stepwise execution．It is also a good idea to test a long or complicated program before relying on it．By stepping through its execution，one line at a time，you can see the result after each program line is executed，so you can verify the progress of known data whose correct results are also known．

1．As for regular execution，make sure program entry is not active（PRGM annunciator off）．
2. Press $⿴ 囗$ GTO label to set the program pointer to the start of the program (that is, at its LBL instruction). The GTO instruction moves the program pointer without starting execution. (If the program is the first or only program, you can press $\boxed{\square}$ GTO $\bullet \square$ to move to its beginning.)
3. Press and hold $\downarrow$. This displays the current program line. When you release $\downarrow$, the line is executed. The result of that execution is then displayed (it is in the X -register).
To move to the preceding line, you can press $\uparrow$. No execution occurs.
4. The program pointer moves to the next line. Repeat step 3 until you find an error (an incorrect result occurs) or reach the end of the program.

If Program-entry mode is active, then $\downarrow$ $\downarrow$ or $\uparrow$ simply changes the program pointer, without executing lines. Holding down a cursor key during program entry makes the lines roll by automatically.

## Example: Testing a Program.

Step through the execution of the program labeled A. Use a radius of 5 for the test data. Check that Program-entry mode is not active before you start:

## Keys: <br> Display: <br> Description: (In RPN mode)

| 5 (GTO A | 5.0006 | Moves program counter to label A. |
| :---: | :---: | :---: |
| $\downarrow$ (hold) | F0001 LEL A |  |
| (release) | 5.0006 |  |
| $\downarrow$ (hold) | H0002 ${ }^{2}$ | Squares input. |
| (release) | 25.0006 |  |
| $\downarrow$ (hold) | H0003 $\pi$ | Value of $\pi$. |
| (release) | 3.1416 |  |
| $\downarrow$ (hold) | F0004 $\times$ | $25 \pi$. |
| (release) | 78.5398 |  |
| $\downarrow$ (hold) | A0005 RTN | End of program. Result is correct. |
| (release) | 78.5398 |  |

## Entering and Displaying Data

The calculator's variables are used to store data input, intermediate results, and final results. (Variables, as explained in chapter 3, are identified by a letter from $A$ through $Z$ or $i$, but the variable names have nothing to do with program labels.)

In a program, you can get data in these ways:

- From an INPUT instruction, which prompts for the value of a variable. (This is the most handy technique.)
- From the stack. (You can use STO to store the value in a variable for later use.)
- From variables that already have values stored.
- From automatic equation prompting (if enabled by flag 11 set).
(This is also handy if you're using equations.)
In a program, you can display information in these ways:
- With a VIEW instruction, which shows the name and value of a variable. (This is the most handy technique.)
- On the stack - only the value in the X -register is visible. (You can use PSE for a 1-second look at the X -register.)
- In a displayed equation (if enabled by flag 10 set). (The "equation" is usually a message, not a true equation.)

Some of these input and output techniques are described in the following topics.

## Using INPUT for Entering Data

The INPUT instruction ( 5 INPUT Variable ) stops a running program and displays a prompt for the given variable. This display includes the existing value for the variable, such as

R ?
0.0006
where
" $R$ " is the variable's name,
"?" is the prompt for information, and
0.0000 is the current value stored in the variable.

Press R/S (run/stop) to resume the program. The value you keyed in then writes over the contents of the X -register and is stored in the given variable. If you have not changed the displayed value, then that value is retained in the X -register.

The area-of-a-circle program with an INPUT instruction looks like this:

| RPN mode | ALG mode |
| :---: | :---: |
| F0001 LEL A | F0061 LEL A |
| F0062 INPUTR | F0002 InPut |
| H0003 ${ }^{2}$ | - $00003 \times 2$ |
| F0064 $\pi$ | F0004 $\times$ |
| F0005 $\times$ | F0005 $\pi$ |
| F0066 RTN | F0006 ENTER |
|  | H0007 RTH |

## To use the INPUT function in a program:

1. Decide which data values you will need, and assign them names. (In the area-of-a-circle example, the only input needed is the radius, which we can assign to $R$.)
2. In the beginning of the program, insert an INPUT instruction for each variable whose value you will need. Later in the program, when you write the part of the calculation that needs a given value, insert a $\mathbb{R C L}$ variable instruction to bring that value back into the stack.

Since the INPUT instruction also leaves the value you just entered in the X-register, you don't have to recall the variable at a later time - you could INPUT it and use it when you need it. You might be able to save some memory space this way. However, in a long program it is simpler to just input all your data up front, and then recall individual variables as you need them.

Remember also that the user of the program can do calculations while the program is stopped, waiting for input. This can alter the contents of the stack, which might affect the next calculation to be done by the program. Thus the program should not assume that the X -, Y -, and Z-registers' contents will be the same before and after the INPUT instruction. If you collect all the data in the beginning and then recall them when needed for calculation, then this prevents the stack's contents from being altered just before a calculation.

For example, see the "Coordinate Transformations" program in chapter 15. Routine $D$ collects all the necessary input for the variables $M, N$, and $T$ (lines D0002 through D0004) that define the $x$ and $y$ coordinates and angle $\theta$ of a new system.

## To respond to a prompt:

When you run the program, it will stop at each INPUT and prompt you for that variable, such as R?日. 0006. The value displayed (and the contents of the $X$-register) will be the current contents of $R$.

- To leave the number unchanged, just press $R / \mathbf{S}$.
- To change the number, type the new number and press $\mathbb{R} / \mathbf{S}$. This new number writes over the old value in the X -register. You can enter a number as a fraction if you want. If you need to calculate a number, use normal keyboard calculations, then press R/S. For example, you can press 2 ENTER 5 Rx $x^{x}$.
- To calculate with the displayed number, press ENTER before typing another number.
- To cancel the INPUT prompt, press $C$. The current value for the variable remains in the $X$-register. If you press $R / S$ to resume the program, the canceled INPUT prompt is repeated. If you press [C] during digit entry, it clears the number to zero. Press again to cancel the INPUT prompt.

## Using VIEW for Displaying Data

The programmed VIEW instruction ( VIEW variable) stops a running program and displays and identifies the contents of the given variable, such as

A=
78.5398

This is a display only, and does not copy the number to the X -register. If Fraction-display mode is active, the value is displayed as a fraction.

- Pressing ENTER copies this number to the X -register.
- If the number is wider than 14 characters, pressing $\square$ SHOW displays the entire number. (If it is a binary number with more than 12 digits, use the $\leftrightarrows$ and $\square$ keys to see the rest.)
- Pressing (or $\triangle$ ) erases the VIEW display and shows the X -register.
- Pressing (LEAR clears the contents of the displayed variable.

Press R/S to continue the program,
If you don't want the program to stop, see "Displaying Information without Stopping" below.

For example, see the program for "Normal and Inverse-Normal Distributions" in chapter 16. Lines T0015 and T0016 at the end of the T routine display the result for X . Note also that this VIEW instruction in this program is preceded by a RCL instruction. The RCL instruction is not necessary, but it is convenient because it brings the VIEWed variable to the X-register, making it available for manual calculations. (Pressing ENTER while viewing a VIEW display would have the same effect.) The other application programs in chapters 15 through 17 also ensure that the VIEWed variable is in the X-register as well - except for the "Polynomial Root Finder" program.

## Using Equations to Display Messages

Equations aren't checked for valid syntax until they're evaluated. This means you can enter almost any sequence of characters into a program as an equation - you enter it just as you enter any equation. On any program line, press EQN to start the equation. Press number and math keys to get numbers and symbols. Press RCL before each letter. Press ENTER to end the equation.

If flag 10 is set, equations are displayed instead of being evaluated. This means you can display any message you enter as an equation. (Flags are discussed in detail in chapter 13.)

When the message is displayed, the program stops - press R/S to resume execution. If the displayed message is longer than 14 characters, the annunciator turns on when the message is displayed. You can then use $\rightarrow$ and $\longleftarrow$ to scroll the display.

If you don't want the program to stop, see "Displaying Information without Stopping" below.

## Example: INPUT, VIEW, and Messages in a Program.

Write an equation to find the surface area and volume of a cylinder given its radius and height. Label the program $C$ (for cylinder), and use the variables $S$ (surface area), V (volume), R (radius), and H (height). Use these formulas:

$$
\begin{gathered}
V=\pi R^{2} H \\
S=2 \pi R^{2}+2 \pi R H=2 \pi R(R+H)
\end{gathered}
$$

## Keys: (In RPN mode)

| R/S | $v=$ | Volume in $\mathrm{cm}^{3}$. |
|  | 157.0796 |  |
| R/S | $\mathrm{s}=$ | Surface area in $\mathrm{cm}^{2}$. |
|  | 164.9336 |  |

## Displaying Information without Stopping

Normally, a program stops when it displays a variable with VIEW or displays an equation message. You normally have to press R/S to resume execution.

If you want, you can make the program continue while the information is displayed. If the next program line - after a VIEW instruction or a viewed equation contains a PSE (pause) instruction, the information is displayed and execution continues after a 1 -second pause. In this case, no scrolling or keyboard input is allowed.

The display is cleared by other display operations, and by the RND operation if flag 7 is set (rounding to a fraction).

Press PSE to enter PSE in a program.
The VIEW and PSE lines - or the equation and PSE lines - are treated as one operation when you execute a program one line at a time.

## Stopping or Interrupting a Program

## Programming a Stop or Pause (STOP, PSE)

- Pressing R/S (run/stop) during program entry inserts a STOP instruction. This will halt a running program until you resume it by pressing R/S from the keyboard. You can use STOP rather than RTN in order to end a program without returning the program pointer to the top of memory.
- Pressing PSE during program entry inserts a PSE (pause) instruction. This will suspend a running program and display the contents of the X-register for about 1 second - with the following exception. If PSE immediately follows a VIEW instruction or an equation that's displayed (flag 10 set), the variable or equation is displayed instead - and the display remains after the 1 -second pause.

## Interrupting a Running Program

You can interrupt a running program at any time by pressing $C$ or $R / S$. The program completes its current instruction before stopping. Press R/S (run/stop) to resume the program.

If you interrupt a program and then press XEQ, (⿴囗GTO, or RTN, you cannot resume the program with R/S. Reexecute the program instead (XEQ label).

## Error Stops

If an error occurs in the course of a running program, program execution halts and an error message appears in the display. (There is a list of messages and conditions in appendix F.)

To see the line in the program containing the error－causing instruction，press $⿴ 囗$ PRGM．The program will have stopped at that point，（For instance，it might be a $\div$ instruction，which caused an illegal division by zero．）

## Editing a Program

You can modify a program in program memory by inserting，deleting，and editing program lines．If a program line contains an equation，you can edit the equation－if any other program line requires even a minor change，you must delete the old line and insert a new one．

## To delete a program line：

1．Select the relevant program or routine（ $⿴ 囗$ GTO label），activate program entry（ $⿴ 囗 \rightarrow \square$ PRGM ），and press $\downarrow$ or to locate the program line that must be changed．Hold the cursor key down to continue scrolling．（If you know the line number you want，pressing $⿴ 囗 \square$ GTO label nnnn moves the program pointer there．）
2．Delete the line you want to change－if it contains an equation，press CLEAR $\{E Q \mathrm{H}\}$ ；otherwise，press $\boxed{\square}$ ．The pointer then moves to the preceding line．（If you are deleting more than one consecutive program line，start with the last line in the group．）
3．Key in the new instruction，if any．This replaces the one you deleted．
4．Exit program entry（ $\mathbb{C}$ or $\square$ PRGM ）．

## To insert a program line：

1．Locate and display the program line that is before the spot where you would like to insert a line．
2．Key in the new instruction；it is inserted after the currently displayed line．
For example，if you wanted to insert a new line between lines A0004 and A0005 of a program，you would first display line A0004，then key in the instruction or instructions．Subsequent program lines，starting with the original line A0005，are moved down and renumbered accordingly．

## To edit an equation in a program line：

1．Locate and display the program line containing the equation．

2．Press $\leftrightarrows$ ．This turns on the＂${ }^{-}$＂editing cursor，but does not delete anything in the equation．
3．Press $\leftrightarrows$ as required to delete the function or number you want to change， then enter the desired corrections．
4．Press ENTER to end the equation．

## Program Memory

## Viewing Program Memory

Pressing $⿴ 囗 \rightarrow$ RRM toggles the calculator into and out of program entry（PRGM annunciator on，program lines displayed）．When Program－entry mode is active， the contents of program memory are displayed．

Program memory starts at PREM TOF．The list of program lines is circular，so you can wrap the program pointer from the bottom to the top and reverse．While program entry is active，there are three ways to change the program pointer（the displayed line）：
 line moves the pointer to FRCM TOF ，while pressing 回 at FRCM TOF moves the pointer to the last program line．

To move more than one line at a time（＂scrolling＂），continue to hold the $\downarrow$ or $\uparrow$ key．
－Press GTO $\square \cdot \square$ to move the program pointer to FRGM TOF．
－Press GTO label nnnn to move to a labeled line number less than 10000.

If Program－entry mode is not active（if no program lines are displayed），you can also move the program pointer by pressing $⿴ 囗 \rightarrow$ GTO label．

Canceling Program－entry mode does not change the position of the program pointer．

## Memory Usage

If during program entry you encounter the message MEMORY FULL，then there is not enough room in program memory for the line you just tried to enter．You can make more room available by clearing programs or other data．See＂Clearing One or More Programs＂below，or＂Managing Calculator Memory＂in appendix B．

## The Catalog of Programs（MEM）

The catalog of programs is a list of all program labels with the number of bytes of memory used by each label and the lines associated with it．Press L⿴囗 MEM \｛PGM\} to display the catalog, and press $\downarrow$ or $\uparrow$ to move within the list．You can use this catalog to：
－Review the labels in program memory and the memory cost of each labeled program or routine．
－Execute a labeled program．（Press XEQ or R／S while the label is displayed．）
－Display a labeled program．（Press $\boxed{\square}$ PRGM while the label is displayed．）
－Delete specific programs．（Press［⿴囗 CLEAR while the label is displayed．）
－See the checksum associated with a given program segment．（Press $\rightarrow$ SHOW．）

The catalog shows you how many bytes of memory each labeled program segment uses．The programs are identified by program label：

LBL C
LNN 67
where 67 is the number of bytes used by the program．

## Clearing One or More Programs

## To clear a specific program from memory

 program．
2．Press $⿴ 囗$ CLEAR．
3．Press $\mathbb{C}$ to cancel the catalog or $\square$ to back out．

## 12－20 Simple Programming

## To clear all programs from memory：

1．Press $⿴ 囗 \rightarrow$ RRGM to display program lines（PRGM annunciator on）．
2．Press $⿴ 囗$ CLEAR $\{P \mathrm{ClH}\}$ to clear program memory．
3．The message CLR PGMS？Y H prompts you for confirmation．Press $\{\mathrm{Y}\}$ ．
4．Press $⿴ 囗 \rightarrow$ PRGM to cancel program entry．
Clearing all of memory（国 CLEAR \｛PLL\}) also clears all programs.

## The Checksum

The checksum is a unique hexadecimal value given to each program label and its associated lines（until the next label）．This number is useful for comparison with a known checksum for an existing program that you have keyed into program memory．If the known checksum and the one shown by your calculator are the same，then you have correctly entered all the lines of the program．To see your checksum：

1．Press $⿴ 囗 \rightarrow$ MEM $\{\mathrm{FClM}\}$ for the catalog of program labels．
2．Display the appropriate label by using the cursor keys，if necessary．
3．Press and hold SHOW to display $\mathrm{CK}=$ checksum and $\mathrm{LH}=$ length．
For example，to see the checksum for the current program（the＂cylinder＂ program）：

## Keys： （In RPN mode）

| ［⿴囗 MEM \｛PGM\} | LEL C | Displays label C ，which |
| :---: | :---: | :---: |
|  | LH＝67 | takes 67 bytes． |
| S SHOW（hold） | CK＝6182 | Checksum and length． |
|  | LiN＝67 |  |

If your checksum does not match this number，then you have not entered this program correctly．

You will see that all of the application programs provided in chapters 15 through 17 include checksum values with each labeled routine so that you can verify the accuracy of your program entry．

In addition，each equation in a program has a checksum．See＂To enter an equation in a program line＂earlier in this chapter．

## Nonprogrammable Functions

The following functions of the HP 33s are not programmable:

```
\square] CLEAR {PCM}
\square] CLEAR {PLL}
\square
\square},\square\uparrow,\longleftarrow,\square
(4) PRGM
(T)
```

## Programming with BASE

You can program instructions to change the base mode using BASE. These settings work in programs just as they do as functions executed from the keyboard. This allows you to write programs that accept numbers in any of the four bases, do arithmetic in any base, and display results in any base.

When writing programs that use numbers in a base other than 10 , set the base mode both as the current setting for the calculator and in the program (as an instruction).

## Selecting a Base Mode in a Program

Insert a BIN, OCT, or HEX instruction into the beginning of the program. You should usually include a DEC instruction at the end of the program so that the calculator's setting will revert to Decimal mode when the program is done.

An instruction in a program to change the base mode will determine how input is interpreted and how output looks during and after program execution, but it does not affect the program lines as you enter them.

Equation evaluation, SOLVE, and $\int$ FN automatically set Decimal mode.

## Numbers Entered in Program Lines

Before starting program entry, set the base mode. The current setting for the base mode determines the base of the numbers that are entered into program lines. The display of these numbers changes when you change the base mode.

Program line numbers always appear in base 10.
An annunciator tells you which base is the current setting. Compare the program lines below in the left and right columns. All non-decimal numbers are right-justified in the calculator's display. Notice how the number 13 appears as "D" in Hexadecimal mode.

## Decimal mode set: Hexadecimal mode set:

| PRGM |  | PRGM | HEX |
| :---: | :---: | :---: | :---: |
| F0069 | HEX | P0069 | HEX |
| PRGM |  | PRGM | HEX |
| F0010 | 13 | F0010 |  |
|  | $\vdots$ |  |  |

## Polynomial Expressions and Horner's Method

Some expressions, such as polynomials, use the same variable several times for their solution. For example, the expression

$$
A x^{4}+B x^{3}+C x^{2}+D x+E
$$

uses the variable $x$ four different times. A program to calculate such an expression using ALG operations could repeatedly recall a stored copy of $x$ from a variable.

## Example:

Write a program using ALG operations for $5 x^{4}+2 x^{3}$, then evaluate it for $x=7$.

## Keys: <br> (In ALG mode)

(4) PRGM 6

Checksum and length: E41A 54

## 13

## Programming Techniques

Chapter 12 covered the basics of programming. This chapter explores more sophisticated but useful techniques:

- Using subroutines to simplify programs by separating and labeling portions of the program that are dedicated to particular tasks. The use of subroutines also shortens a program that must perform a series of steps more than once.
- Using conditional instructions (comparisons and flags) to determine which instructions or subroutines should be used.
- Using loops with counters to execute a set of instructions a certain number of times.
- Using indirect addressing to access different variables using the same program instruction.

## Routines in Programs

A program is composed of one or more routines. A routine is a functional unit that accomplishes something specific. Complicated programs need routines to group and separate tasks. This makes a program easier to write, read, understand, and alter.

For example, look at the program for "Normal and Inverse-Normal Distributions" in chapter 16. Routine $S$ "initializes" the program by collecting the input for the mean and standard deviation. Routine $D$ sets a limit of integration, executes routine $Q$, and displays the result. Routine $Q$ integrates the function defined in routine F and finishes the probability calculation of $Q(x)$.

A routine typically starts with a label (LBL) and ends with an instruction that alters or stops program execution, such as RTN, GTO, or STOP, or perhaps another label.

## Calling Subroutines (XEQ, RTN)

A subroutine is a routine that is called from (executed by) another routine and returns to that same routine when the subroutine is finished. The subroutine must start with a LBL and end with a RTN. A subroutine is itself a routine, and it can call other subroutines.

- XEQ must branch to a label (LBL) for the subroutine. (It cannot branch to a line number.)
- At the very next RTN encountered, program execution returns to the line after the originating $X E Q$.

For example, routine $Q$ in the "Normal and Inverse-Normal Distributions" program in chapter 16 is a subroutine (to calculate $Q(x)$ ) that is called from routine $D$ by line 00003 XEQ $Q$. Routine $Q$ ends with a RTN instruction that sends program execution back to routine D (to store and display the result) at line D0004.
See the flow diagrams below.
The flow diagrams in this chapter use this notation:

| F0005 [GTO B $\rightarrow$ (1) | Program execution branches from this line to the line marked $\leftarrow$ (1) ("from 1"). |
| :---: | :---: |
| B0001 LELE | Program execution branches from a line marked $\rightarrow$ (1) ("to 1") to this line. |

## 13-2 Programming Techniques

## Nested Subroutines

A subroutine can call another subroutine, and that subroutine can call yet another subroutine. This "nesting" of subroutines - the calling of a subroutine within another subroutine - is limited to a stack of subroutines seven levels deep (not counting the topmost program level). The operation of nested subroutines is as shown below:

MAIN program (top level)

## End of program

Attempting to execute a subroutine nested more than seven levels deep causes an XEQ OVERFLOW error.

## Example: A Nested Subroutine.

The following subroutine, labeled $S$, calculates the value of the expression

$$
\sqrt{a^{2}+b^{2}+c^{2}+d^{2}}
$$

as part of a larger calculation in a larger program. The subroutine calls upon another subroutine (a nested subroutine), labeled $Q$, to do the repetitive squaring and addition. This saves memory by keeping the program shorter than it would be without the subroutine.

In RPN mode,

## Branching (GTO)

As we have seen with subroutines, it is often desirable to transfer execution to a part of the program other than the next line. This is called branching.

Unconditional branching uses the GTO (go to) instruction to branch to a program label. It is not possible to branch to a specific line number during a program.

## A Programmed GTO Instruction

The GTO label instruction (press GTO label) transfers the execution of a running program to the program line containing that label, wherever it may be. The program continues running from the new location, and never automatically returns to its point of origination, so GTO is not used for subroutines.

For example, consider the "Curve Fitting" program in chapter 16. The GTO Z instruction branches execution from any one of three independent initializing routines to LBL $Z$, the routine that is the common entry point into the heart of the program:

## Using GTO from the Keyboard

You can use $\boxed{\boxed{G} \text { GTO to move the program pointer to a specified label or line }}$ number without starting program execution.

- To FREM TOF: $\boxed{\square}$ GTO $\bullet \rightarrow$.
- To a line number: GTO $\square$ label nnnn (nnnn < 10000). For example, (G) GTO $\cdot \rightarrow$ A0005.
- To a label: GTO label - but only if program entry is not active (no program lines displayed; PRGM off). For example, $\mathbf{\boxed { G T O } \text { A. }}$

## Conditional Instructions

Another way to alter the sequence of program execution is by a conditional test, a true/false test that compares two numbers and skips the next program instruction if the proposition is false.

For instance, if a conditional instruction on line A0005 is $x=0 ?$ (that is, is $x$ equal to zero?), then the program compares the contents of the $X$-register with zero. If the $X$-register does contain zero, then the program goes on to the next line. If the X-register does not contain zero, then the program skips the next line, thereby branching to line A0007. This rule is commonly known as "Do if true."

The above example points out a common technique used with conditional tests: the line immediately after the test (which is only executed in the "true" case) is a branch to another label. So the net effect of the test is to branch to a different routine under certain circumstances.

There are three categories of conditional instructions:

- Comparison tests. These compare the X -and Y -registers, or the X -register and zero.
－Flag tests．These check the status of flags，which can be either set or clear．
－Loop counters．These are usually used to loop a specified number of times．

## Tests of Comparison（ $\mathbf{x} \boldsymbol{?} \mathbf{y}, \mathbf{x} \boldsymbol{?} \mathbf{0}$ ）

There are 12 comparisons available for programming．Pressing 国 x？y or $\square x$ ？displays a menu for one of the two categories of tests：
－$x$ ？$y$ for tests comparing $x$ and $y$ ．
－$x$ ？ 0 for tests comparing $x$ and 0 ．
Remember that $x$ refers to the number in the $X$－register，and $y$ refers to the number in the Y －register．These do not compare the variables X and Y ．

Select the category of comparison，then press the menu key for the conditional instruction you want．

The Test Menus

| $x ? y$ | $x ? 0$ |
| :---: | :---: |
| $\{\neq\}$ for $x \neq y ?$ | $\{\neq\}$ for $x \neq 0 ?$ |
| $\{\leq\}$ for $x \leq y ?$ | $\{\leq\}$ for $x \leq 0 ?$ |
| $\{<\}$ for $x<y ?$ | $\{<\}$ for $x<0 ?$ |
| $\{>\}$ for $x>y ?$ | $\{>\}$ for $x>0 ?$ |
| $\{\geq\}$ for $x \geq y ?$ | $\{\geq\}$ for $x \geq 0 ?$ |
| $\{=\}$ for $x=y ?$ | $\{=\}$ for $x=0 ?$ |

If you execute a conditional test from the keyboard，the calculator will display YES or HO ．

For example，if $x=2$ and $y=7$ ，test $x<y$ ．
Keys：
Display：
$\begin{array}{lll}\text { In RPN mode } & 7 \text { ENTER } 2 \text { 图 x？y }\{<\} & \text { YES } \\ \text { In ALG mode } & 7 x \rightarrow y 2 \text { 回 x？y }\{<\} & \text { YES }\end{array}$

## Example:

The "Normal and Inverse-Normal Distributions" program in chapter 16 uses the $x<y$ ? conditional in routine T :

## Program Lines: (In RPN mode)

## Description

T0069 -
T0010 STO+ X
T0011 1 ABS
T00120.0001
TG013x<y?
Tests to see if the correction is significant.
TG014 GT0T

TG015 RCL \%
TGO16 VIEMX
Calculates the correction for $\mathrm{X}_{\text {guess }}$.
Adds the correction to yield a new $X$ guess.

Goes back to start of loop if correction is significant.
Continues if correction is not significant.

Displays the calculated value of $X$.

Line T0009 calculates the correction for $\mathrm{X}_{\text {guess. }}$. Line T0013 compares the absolute value of the calculated correction with 0.0001 . If the value is less than 0.0001 ("Do If True"), the program executes line T0014; if the value is equal to or greater than 0.0001, the program skips to line T0015.

## Flags

A flag is an indicator of status. It is either set (true) or clear (false). Testing a flag is another conditional test that follows the "Do if true" rule: program execution proceeds directly if the tested flag is set, and skips one line if the flag is clear.

## Meanings of Flags

The HP 33s has 12 flags, numbered 0 through 11. All flags can be set, cleared, and tested from the keyboard or by a program instruction. The default state of all 12 flags is clear. The three-key memory clearing operation described in appendix $B$ clears all flags. Flags are not affected by CLEAR \{PLL\} $\left\{\left\{^{\prime}\right\}\right.$.

## 13-8 Programming Techniques

－Flags 0，1，2，3，and 4 have no preassigned meanings．That is，their states will mean whatever you define them to mean in a given program．（See the example below．）
－Flag 5，when set，will interrupt a program when an overflow occurs within the program，displaying OUERFLOW and A．An overflow occurs when a result exceeds the largest number that the calculator can handle．The largest possible number is substituted for the overflow result．If flag 5 is clear，a program with an overflow is not interrupted，though OVERFLOW is displayed briefly when the program eventually stops．
－Flag 6 is automatically set by the calculator any time an overflow occurs （although you can also set flag 6 yourself）．It has no effect，but can be tested．

Flags 5 and 6 allow you to control overflow conditions that occur during a program．Setting flag 5 stops a program at the line just after the line that caused the overflow．By testing flag 6 in a program，you can alter the program＇s flow or change a result anytime an overflow occurs．
－Flags 7， 8 and 9 control the display of fractions．Flag 7 can also be controlled from the keyboard．When Fraction－display mode is toggled on or off by pressing $⿴ 囗 大$ FDISP，flag 7 is set or cleared as well．

| Flag <br> Status | Fraction－Control Flags |  |  |
| :---: | :--- | :--- | :--- |
|  | Fraction display <br> off；display real <br> numbers in the <br> current display <br> format． | Fraction <br> denominators not <br> greater than the <br> ／c value． | Reduce fractions <br> to smallest form． |
|  | Fraction display <br> on；display real <br> numbers as <br> fractions． | Fraction <br> denominators are <br> factors of the $/ c$ <br> Value． | No reduction of <br> fractions．（Used <br> only if flag 8 is <br> set．） |

- Flag $\mathbf{1 0}$ controls program execution of equations:

When flag 10 is clear (the default state), equations in running programs are evaluated and the result put on the stack.

When flag 10 is set, equations in running programs are displayed as messages, causing them to behave like a VIEW statement:

1. Program execution halts.
2. The program pointer moves to the next program line.
3. The equation is displayed without affecting the stack. You can clear the display by pressing $\leftrightarrows$ or . Pressing any other key executes that key's function.
4. If the next program line is a PSE instruction, execution continues after a 1-second pause.
The status of flag 10 is controlled only by execution of the SF and CF operations from the keyboard, or by SF and CF statements in programs.

- Flag 11 controls prompting when executing equations in a program - it doesn't affect automatic prompting during keyboard execution:

When flag 11 is clear (the default state), evaluation, SOLVE, and $\int \mathrm{FN}$ of equations in programs proceed without interruption. The current value of each variable in the equation is automatically recalled each time the variable is encountered. INPUT prompting is not affected.

When flag 11 is set, each variable is prompted for when it is first encountered in the equation. A prompt for a variable occurs only once, regardless of the number of times the variable appears in the equation. When solving, no prompt occurs for the unknown; when integrating, no prompt occurs for the variable of integration. Prompts halt execution. Pressing R/S] resumes the calculation using the value for the variable you keyed in, or the displayed (current) value of the variable if $\mathbb{R} / \mathbf{S}$ is your sole response to the prompt.

Flag 11 is automatically cleared after evaluation, SOLVE, or $\int \mathrm{FN}$ of an equation in a program. The status of flag 11 is also controlled by execution of the SF and CF operations from the keyboard, or by SF and CF statements in programs.

## Annunciators for Set Flags

Flags $0,1,2,3$ and 4 have annunciators in the display that turn on when the corresponding flag is set. The presence or absence of $\mathbf{0}, \mathbf{1}, \mathbf{2}, \mathbf{3}$ or $\mathbf{4}$ lets you know at any time whether any of these five flags is set or not. However, there is no such indication for the status of flags 5 through 11. The statuses of these flags can be determined by executing the FS? instruction from the keyboard. (See "Using Flags" below.)

## Using Flags

## Pressing FLAGS displays the FLAGS menu: $\{\mathrm{SF}\}\{$ \{CF\} $\{\mathrm{FS}$ ? $\}$

After selecting the function you want, you will be prompted for the flag number (0-11). For example, press $\square \boldsymbol{\square L A G S}\{\mathrm{SF}\} 0$ to set flag 0 ; press $\boldsymbol{\square}$ FLAGS $\{\mathrm{SF}\} \cdot 0$ to set flag 10; press $\boldsymbol{\square} \boldsymbol{F L A G S}\{\mathrm{SF}\} \cdot 1$ to set flag 11.

## FLAGS Menu

| Menu Key | Description |
| :--- | :--- |
| $\{\mathrm{SF}\} n$ | Set flag. Sets flag $n$. |
| $\{\mathrm{CF}\} n$ | Clear flag. Clears flag $n$. |
| $\{\mathrm{FS} ?\} n$ | Is flag set? Tests the status of flag $n$. |

A flag test is a conditional test that affects program execution just as the comparison tests do. The FS? $n$ instruction tests whether the given flag is set. If it is, then the next line in the program is executed. If it is not, then the next line is skipped. This is the "Do if True" rule, illustrated under "Conditional Instructions" earlier in this chapter.

If you test a flag from the keyboard, the calculator will display "YES" or "HO".
It is good practice in a program to make sure that any conditions you will be testing start out in a known state. Current flag settings depend on how they have been left by earlier programs that have been run. You should not assume that any given flag is clear, for instance, and that it will be set only if something in the program sets it. You should make sure of this by clearing the flag before the condition arises that might set it. See the example below.

## Example: Using Flags.

The "Curve Fitting" program in chapter 16 uses flags 0 and 1 to determine whether to take the natural logarithm of the X - and Y -inputs:

- Lines S0003 and S0004 clear both of these flags so that lines W0007 and W0011 (in the input loop routine) do not take the natural logarithms of the X - and Y -inputs for a Straight-line model curve.
■ Line L0003 sets flag 0 so that line W0007 takes the natural log of the X-input for a Logarithmic-model curve.
- Line EOOO4 sets flag 1 so that line W0011 takes the natural log of the Y-input for an Exponential-model curve.
- Lines P0003 and P0004 set both flags so that lines W0007 and W0011 take the natural logarithms of both the X - and Y -inputs for a Power-model curve.

Note that lines S0003, S0004, L0004, and EOOO3 clear flags 0 and 1 to ensure that they will be set only as required for the four curve models.

## 13-12 Programming Techniques

## Program Lines: <br> (In RPN mode)

## Description:

| 50003 CF 0 | Clears flag 0, the indicator for $\ln X$. |
| ---: | ---: |
| 50004 CF 1 |  |
| Clears flag 1, the indicator for $\ln Y$. |  |

W0066 FS? 0
W0607 LH

W610 FS? 1
W0011 LH

If flag 0 is set ...
... takes the natural log of the $X$-input.

If flag 1 is set ...
... takes the natural log of the $Y$-input.

## Example: Controlling the Fraction Display.

The following program lets you exercise the calculator's fraction-display capability. The program prompts for and uses your inputs for a fractional number and a denominator (the $/ \mathrm{c}$ value). The program also contains examples of how the three fraction-display flags (7, 8, and 9) and the "message-display" flag (10) are used.

Messages in this program are listed as MESSAGE and are entered as equations:

1. Set Equation-entry mode by pressing EQN (the EQN annunciator turns on).
2. Press [RCL letter for each alpha character in the message; press [SPACE] (the R/S key) for each space character.
3. Press ENTER to insert the message in the current program line and end Equation-entry mode.

## 13-14 Programming Techniques

Program Lines:
(In ALG mode)

Use the above program to see the different forms of fraction display:

| XEQ F | v? <br> value | Executes label F; prompts for a fractional number ( $V$ ). |
| :---: | :---: | :---: |
| $2.53 \mathrm{R} / \mathrm{S}$ | [? <br> value | Stores 2.53 in V; prompts for denominator (D). |
| 16 R/S | $\begin{aligned} & \text { DECIMAL } \\ & 2.5300 \end{aligned}$ | Stores 16 as the /c value. Displays message, then the decimal number. |
| R/S | MOST PRECISE $28 / 15 \mathrm{~V}$ | Message indicates the fraction format (denominator is no greater than 16), then shows the fraction. indicates that the numerator is "a little below" 8. |
| R/S | FACTOR DEHOM 21/2 | Message indicates the fraction format (denominator is factor of 16), then shows the fraction. |
| R/S | FIMED DEHOM $28 / 16$ - | Message indicates the fraction format (denominator is 16), then shows the fraction. |
| R/S $C$ | 2.5300 | Stops the program and clears flag |
| ( FLAGS $\{\mathrm{CF}\}, \square$ |  | 10 |

## Loops

Branching backwards - that is, to a label in a previous line - makes it possible to execute part of a program more than once. This is called looping.

D0001 LEL D
D0062 INFUTM
D0003 INPUT H
D0004 INPUT T
D0005 GTOD

## 13-16 Programming Techniques

This routine (taken from the "Coordinate Transformations" program on page 15-32 in chapter 15) is an example of an infinite loop. It is used to collect the initial data prior to the coordinate transformation. After entering the three values, it is up to the user to manually interrupt this loop by selecting the transformation to be performed (pressing XEQ N for the old-to-new system or XEQ O for the new-to-old system).

## Conditional Loops (GTO)

When you want to perform an operation until a certain condition is met, but you don't know how many times the loop needs to repeat itself, you can create a loop with a conditional test and a GTO instruction.

For example, the following routine uses a loop to diminish a value A by a constant amount $B$ until the resulting $A$ is less than or equal to $B$.

```
Program lines:
Description:
(In RPN mode)
A0001 LEL A
F0002 IFPUT A
R0003 INPUT B
Checksum and length: D548 9
S0001 LBL S
S0002 RCL A It is easier to recall }A\mathrm{ than to remember where it is in the
    stack.
S0003 RCL-B Calculates A - B.
S0004 STO A Replaces old A with new result.
S0005 RCL B Recalls constant for comparison.
50006 x<y? Is B < new A?
S0007 GT0S Yes: loops to repeat subtraction.
S0008 VIE|P No: displays new A.
S0009 RTN
Checksum and length: AC36 27
```

## Loops with Counters（DSE，ISG）

When you want to execute a loop a specific number of times，use the ISG （increment；skip if greater than）or DSE（decrement；skip if less than or equal to）conditional function keys．Each time a loop function is executed in a program，it automatically decrements or increments a counter value stored in a variable．It compares the current counter value to a final counter value，then continues or exits the loop depending on the result．

For a count－down loop，use DSE variable
For a count－up loop，use $⿴ 囗$ ISG variable
These functions accomplish the same thing as a FOR－NEXT loop in BASIC：
FOR variable $=$ initial－value TO final－value STEF increment

## NEXT variable

A DSE instruction is like a FOR－NEXT loop with a negative increment．
After pressing a shifted key for ISG or DSE（ $⿴ 囗 \rightarrow$ ISG or DSE ），you will be prompted for a variable that will contain the loop－control number（described below）．

## The Loop－Control Number

The specified variable should contain a loop－control number $\pm$ ccccccc．fffii，where：
－$\pm c c c c c c c$ is the current counter value（ 1 to 12 digits）．This value changes with loop execution．
－fff is the final counter value（must be three digits）．This value does not change as the loop runs．
－ii is the interval for incrementing and decrementing（must be two digits or unspecified）．This value does not change．An unspecified value for ii is assumed to be 01 （increment／decrement by 1 ）．

Given the loop－control number ccccccc．fffii，DSE decrements ccccccc to ccccccc－ii，compares the new ccccccc with fff，and makes program execution skip the next program line if this ccccccc $\leq$ fff．

## 13－18 Programming Techniques

Given the loop-control number ccccccc. fffii, ISG increments ccccccc to ccccccc + ii, compares the new ccccccc with fff, and makes program execution skip the next program line if this ccccccc > fff.

| If current value > final value, continue loop. | (1) $\rightarrow$ <br> (1) $\leftarrow$ | W0001 LEL <br> W0069 DSE R <br> WGO10 GTO <br> W6011 KEQ K | $\rightarrow$ (2) <br> $\leftarrow$ (2) | If current value $\leq$ final value, exit loop. |
| :---: | :---: | :---: | :---: | :---: |
| If current value $\leq$ final value, continue loop. | (1) $\rightarrow$ <br> (1) $\leftarrow$ | W0001 LEL <br> W6009 ISG <br> W6010 GTO <br> WGO11 KEQ X | $\rightarrow$ (2) <br> $\leftarrow$ (2) | If current value $>$ final value, exit loop. |

For example, the loop-control number 0.050 for ISG means: start counting at zero, count up to 50 , and increase the number by 1 each loop.

The following program uses ISG to loop 10 times. The loop counter (0000001.01000) is stored in the variable Z. Leading and trailing zeros can be left off.

M0001 LEL M
Monge Isg 2
M0003 GTOM
M0004 RTN
Press VIEW $Z$ to see that the loop-control number is now 11.0100 .

## Indirectly Addressing Variables and Labels

Indirect addressing is a technique used in advanced programming to specify a variable or label without specifying beforehand exactly which one. This is determined when the program runs, so it depends on the intermediate results (or input) of the program.

Indirect addressing uses two different keys: $i$ (with $-\square$ ) and (i) (with ENTER).
The variable I has nothing to do with (i)] or the variable $i$. These keys are active for many functions that take $A$ through $Z$ as variables or labels.

- $\quad i$ is a variable whose contents can refer to another variable or label. It holds a number just like any other variable ( $A$ through $Z$ ).
- (i) is a programming function that directs, "Use the number in i to determine which variable or label to address."
This is an indirect address. (A through $Z$ are direct addresses.)
Both id and (i) are used together to create an indirect address. (See the examples below.)

By itself, $i$ is just another variable.
By itself, (i)] is either undefined (no number in i) or uncontrolled (using whatever number happens to be left over in i).

## The Variable "i"

Your can store, recall, and manipulate the contents of $i$ just as you can the contents of other variables. You can even solve for $i$ and integrate using $i$. The functions listed below can use variable " $i$ ".

| STO i | INPUT i | DSE i |
| :--- | :--- | :--- |
| RCL i | VIEW i | ISG i |
| STO,,$+- \times, \div \mathrm{i}$ | $\int$ FN d i | $x<>\mathrm{i}$ |
| RCL,,$+- \times, \div \mathrm{i}$ | SOLVE i |  |

## The Indirect Address, (i)

Many functions that use A through $Z$ (as variables or labels) can use (i) to refer to A through Z (variables or labels) or statistics registers indirectly. The function (i)] uses the value in variable $i$ to determine which variable, label, or register to address. The following table shows how.

| If $\mathbf{i}$ contains: | Then (i) will address: |
| :---: | :---: |
| $\pm 1$ | variable $A$ or label $A$ |
| $\vdots$ | $\vdots$ |
| $\pm 26$ | variable $Z$ or label $Z$ |
| $\pm 27$ | variable $i$ |
| $\pm 28$ | $n$ register |
| $\pm 29$ | $\Sigma x$ register |
| $\pm 30$ | $\Sigma y$ register |
| $\pm 31$ | $\Sigma x^{2}$ register |
| $\pm 32$ | $\Sigma y^{2}$ register |
| $\pm 33$ | $\Sigma x y$ register |
| $\geq 34$ or $\leq-34$ or 0 | error: I $\# \cup A L I D\langle i\rangle$ |

Only the absolute value of the integer portion of the number in $i$ is used for addressing.

The INPUT(i) and VIEW(i) operations label the display with the name of the indirectly-addressed variable or register.

The SUMS menu enables you to recall values from the statistics registers. However, you must use indirect addressing to do other operations, such as STO, VIEW, and INPUT.

The functions listed below can use (i) as an address. For GTO, XEQ, and FN=, (i) refers to a label; for all other functions (i) refers to a variable or register.

STO(i)
RCL(i)
STO $+,-, x, \div$, (i)
RCL $+,-, x, \div$ (i)
XEQ(i)
GTO(i)
X<>(i)

INPUT(i)
VIEW(i)
DSE(i)
ISG(i)
SOLVE(i)
$\int \mathrm{FN} \mathrm{d}$ (i)
$\mathrm{FN}=(\mathrm{i})$

## Program Control with (i)

Since the contents of $i$ can change each time a program runs - or even in different parts of the same program - a program instruction such as $\mathrm{GTO}(\mathrm{i})$ can branch to a different label at different times. This maintains flexibility by leaving open (until the program runs) exactly which variable or program label will be needed. (See the first example below.)

Indirect addressing is very useful for counting and controlling loops. The variable $i$ serves as an index, holding the address of the variable that contains the loop-control number for the functions DSE and ISG. (See the second example below.)

## Example: Choosing Subroutines With (i).

The "Curve Fitting" program in chapter 16 uses indirect addressing to determine which model to use to compute estimated values for $x$ and $y$. (Different subroutines compute $x$ and $y$ for the different models.) Notice that $i$ is stored and then indirectly addressed in widely separated parts of the program.

The first four routines ( $S, L, E, P$ ) of the program specify the curve-fitting model that will be used and assign a number $(1,2,3,4)$ to each of these models. This number is then stored during routine $Z$, the common entry point for all models:

20003 STo i
Routine Y uses $i$ to call the appropriate subroutine (by model) to calculate the $x$ and $y$-estimates. Line YOOO3 calls the subroutine to compute $\hat{y}$ :

Y0003 XEQ(i)
and line Y0008 calls a different subroutine to compute $\hat{x}$ after $i$ has been increased by 6 :

| If i holds: | Then XEQ(i) calls: | To: |
| :---: | :---: | :--- |
| 1 | LBL A | Compute $\hat{y}$ for straight-line model. |
| 2 | LBL B | Compute $\hat{y}$ for logarithmic model. |
| 3 | LBL C | Compute $\hat{y}$ for exponential model. |
| 4 | LBL D | Compute $\hat{y}$ for power model. |
| 7 | LBL G | Compute $\hat{x}$ for straight-line model. |
| 8 | LBL H | Compute $\hat{x}$ for logarithmic model. |
| 9 | LBL I | Compute $\hat{x}$ for exponential model. |
| 10 | LBL J | Compute $\hat{x}$ for power model. |

## Example: Loop Control With (i).

An index value in $i$ is used by the program "Solutions of Simultaneous Equations Marrix Inversion Method" in chapter 15. This program uses the looping instructions ISE $i$ and DSE $i$ in conjunction with the indirect instructions $\mathrm{RCL}(\mathrm{i})$ and $\mathrm{STO}(\mathrm{i})$ to fill and manipulate a matrix.

The first part of this program is routine A, which stores the initial loop-control number in $i$.

## Program lines: (In RPN mode)

P0061 LBL $\mathrm{F} \quad$ The starting point for data input.
A00021.012 Loop-control number: loop from 1 to 12 in intervals of 1.
A0003 ST0 i Stores loop-control number in i.
The next routine is $L$, a loop to collect all 12 known values for a $3 \times 3$ coefficient matrix (variables $A-I$ ) and the three constants ( $J-l$ ) for the equations.

## 14

## Solving and Integrating Programs

## Solving a Program

In chapter 7 you saw how you can enter an equation - it's added to the equation list - and then solve it for any variable. You can also enter a program that calculates a function, and then solve it for any variable. This is especially useful if the equation you're solving changes for certain conditions or if it requires repeated calculations.

## To solve a programmed function:

1. Enter a program that defines the function. (See "To write a program for SOLVE" below.)
2. Select the program to solve: press $\boldsymbol{P N}=$ label. (You can skip this step if you're re-solving the same program.)
3. Solve for the unknown variable: press SOLVE variable.

Notice that $\mathrm{FN}=$ is required if you're solving a programmed function, but not if you're solving an equation from the equation list.

To halt a calculation, press $C$ or R/S. The current best estimate of the root is in the unknown variable; use Vlew to view it without disturbing the stack. To resume the calculation, press R/S.

## To write a program for SOLVE:

The program can use equations and ALG or RPN operations - in whatever combination is most convenient.

1. Begin the program with a label. This label identifies the function that you want SOLVE to evaluate ( $\mathrm{F} \mathrm{H}=$ label).
2. Include an INPUT instruction for each variable, including the unknown. INPUT instructions enable you to solve for any variable in a multi-variable function. INPUT for the unknown is ignored by the calculator, so you need to write only one program that contains a separate INPUT instruction for every variable (including the unknown).

If you include no INPUT instructions, the program uses the values stored in the variables or entered at equation prompts.
3. Enter the instructions to evaluate the function.

- A function programmed as a multi-line RPN or ALG sequence must be in the form of an expression that goes to zero at the solution. If your equation is $f(x)=g(x)$, your program should calculate $f(x)-g(x)$. " $=0$ " is implied.
- A function programmed as an equation can be any type of equation equality, assignment, or expression. The equation is evaluated by the program, and its value goes to zero at the solution. If you want the equation to prompt for variable values instead of including INPUT instructions, make sure flag 11 is set.

4. End the program with a RTN. Program execution should end with the value of the function in the X -register.

If the program contains a VIEW or STOP instruction, or a message for display (an equation with Flag 10 set), then the instruction is normally executed only once - it is not executed each time the program is called by SOLVE. However, if VIEW or a message is followed by PSE, then the value or message will be displayed for one second each time the program is called. (STOP followed by PSE is ignored.)

SOLVE works only with real numbers. However, if you have a complex-valued function that can be written to isolate its real and imaginary parts, SOLVE can solve for the parts separately.

## Example: Program Using ALG.

Write a program using ALG operations that solves for any unknown in the equation for the "Ideal Gas Law." The equation is:

$$
P \times V=N \times R \times T
$$

where
$P=$ Pressure (atmospheres or $\mathrm{N} / \mathrm{m}^{2}$ ).
$\mathrm{V}=$ Volume (liters).
$\mathrm{N}=$ Number of moles of gas.
$R=$ The universal gas constant ( 0.0821 liter-atm/mole-K or $8.314 \mathrm{~J} / \mathrm{mole}-\mathrm{K}$ ).
$\mathrm{T}=$ Temperature (kelvins; $\mathrm{K}={ }^{\circ} \mathrm{C}+273.1$ ).

To begin, put the calculator in Program mode; if necessary, position the program pointer to the top of program memory.

|  |  |  |

## Using SOLVE in a Program

You can use the SOLVE operation as part of a program.
If appropriate, include or prompt for initial guesses (into the unknown variable and into the X-register) before executing the SOLVE variable instruction. The two instructions for solving an equation for an unknown variable appear in programs as:
$\mathrm{FN}=$ label
sOLVE variable
The programmed SOLVE instruction does not produce a labeled display (variable = value) since this might not be the significant output for your program (that is, you might want to do further calculations with this number before displaying it). If you do want this result displayed, add a VIEW variable instruction after the SOLVE instruction.

If no solution is found for the unknown variable, then the next program line is skipped (in accordance with the "Do if True" rule, explained in chapter 13). The program should then handle the case of not finding a root, such as by choosing new initial estimates or changing an input value.

## Example: SOLVE in a Program.

The following excerpt is from a program that allows you to solve for $x$ or $y$ by pressing XEQ X or Y .

## Program Lines: <br> (In RPN mode)

Setup for $Y$.
Index for $Y$.
Branches to main routine.

Main routine.
Stores index in $i$.
Defines program to solve.
Solves for appropriate variable.
Displays solution.
Ends program.

Calculates $f(x, y)$. Include INPUT or equation prompting as required.

## Integrating a Program

In chapter 8 you saw how you can enter an equation (or expression) - it's added to the list of equations - and then integrate it with respect to any variable. You can also enter a program that calculates a function, and then integrate it with respect to any variable. This is especially useful if the function you're integrating changes for certain conditions or if it requires repeated calculations.

## To integrate a programmed function:

1. Enter a program that defines the integrand's function. (See "To write a program for $\int$ FN" below.)
2. Select the program that defines the function to integrate: press $\square \mathbb{F N}=$ label. (You can skip this step if you're reintegrating the same program.)
3. Enter the limits of integration: key in the lower limit and press ENTER, then key in the upper limit.
4. Select the variable of integration and start the calculation: press $\square$ variable.

Notice that $\mathrm{FN}=$ is required if you're integrating a programmed function, but not if you're integrating an equation from the equation list.

You can halt a running integration calculation by pressing $[\mathbf{C}$ or $\mathbb{R} / \mathbf{S}$. However, the calculation cannot be resumed.

## To write a program for $\int \mathrm{FN}$ :

The program can use equations, ALG or RPN operations - in whatever combination is most convenient.

1. Begin the program with a label. This label identifies the function that you want to integrate ( $\mathrm{FN}=$ label).
2. Include an INPUT instruction for each variable, including the variable of integration. INPUT instructions enable you to integrate with respect to any variable in a multi-variable function. INPUT for the variable of integration is ignored by the calculator, so you need to write only one program that contains a separate INPUT instruction for every variable (including the variable of integration).

If you include no INPUT instructions, the program uses the values stored in the variables or entered at equation prompts.
3. Enter the instructions to evaluate the function.

- A function programmed as a multi-line RPN or ALG sequence must calculate the function values you want to integrate.
- A function programmed as an equation is usually included as an expression specifying the integrand - though it can be any type of equation. If you want the equation to prompt for variable values instead of including INPUT instructions, make sure flag 11 is set.

4. End the program with a RTN. Program execution should end with the value of the function in the X -register.

## Example: Program Using Equation.

The sine integral function in the example in chapter 8 is

$$
S i(t)=\int_{0}^{t}\left(\frac{\sin x}{x}\right) d x
$$

This function can be evaluated by integrating a program that defines the integrand:

| S0001 LELS | Defines the function. |
| :--- | :--- |
| $s 0002 \mathrm{SIH}(\mathrm{K}) \div \mathrm{K}$ | The function as an expression. (Checksum and length: |
|  | OEEO 8). |
| S0003 RTH | Ends the subroutine |
| Checksum and length of program: BDE3 17 |  |

Enter this program and integrate the sine integral function with respect to $x$ from 0 to $2(t=2)$.

1.6054

2

Restores Degrees mode.

## Using Integration in a Program

Integration can be executed from a program. Remember to include or prompt for the limits of integration before executing the integration, and remember that accuracy and execution time are controlled by the display format at the time the program runs. The two integration instructions appear in the program as:
$\mathrm{FN}=$ label
$\int \mathrm{FH}$ d variable
The programmed $\int \mathrm{FN}$ instruction does not produce a labeled display ( $\int=$ value) since this might not be the significant output for your program (that is, you might want to do further calculations with this number before displaying it). If you do want this result displayed, add a PSE ( $\rightarrow$ PSE ) or STOP (R/S) instruction to display the result in the X -register after the $\int \mathrm{FN}$ instruction.

If the program contains a VIEW or STOP instruction, or a message for display (an equation with Flag 10 set), then the instruction is normally executed only once - it is not executed each time the program is called by $\int \mathrm{FN}$. However, if VIEW or a message is followed by PSE, then the value or message will be displayed for one second each time the program is called. (STOP followed by PSE is ignored.)

## Example: $\int$ FN in a Program.

The "Normal and Inverse-Normal Distributions" program in chapter 16 includes an integration of the equation of the normal density function

$$
\frac{1}{S \sqrt{2 \pi}} \int_{M}^{D} e^{-\left(\frac{D-M}{S}\right)^{2} / 2} d D .
$$

The $e^{((D-M) \div S)^{2} \div 2}$ function is calculated by the routine labeled $F$. Other routines prompt for the known values and do the other calculations to find $Q(D)$, the upper-tail area of a normal curve. The integration itself is set up and executed from routine $Q$ :

Q0001 LBL Q
Q6062 RCL M Recalls lower limit of integration.
Q0003 RCL $X \quad$ Recalls upper limit of integration. $(X=D$.
Q0004 FH=F Specifies the function.
Q0065 FH \& C Integrates the normal function using the dummy variable $D$.

## Restrictions on Solving and Integrating

The SOLVE variable and $\int \mathrm{FN} \mathrm{d}$ variable instructions cannot call a routine that contains another SOLVE or $\int \mathrm{FN}$ instruction. That is, neither of these instructions can be used recursively. For example, attempting to calculate a multiple integral will result in an $\int\left(\int F H\right)$ error. Also, SOLVE and $\int F N$ cannot call a routine that contains an $\mathrm{FH}=$ label instruction; if attempted, a SOLVE RCTIVE or $\int \mathrm{FH}$ ACTIVE error will be returned. SOLVE cannot call a routine that contains an $\int F N$ instruction (produces a SOLVE ( $\int \mathrm{FH}$ ) error), just as $\int \mathrm{FN}$ cannot call a routine that contains a SOLVE instruction (produces an $\int(\mathrm{SOLVE})$ error).
The SOLVE variable and $\int$ FN d variable instructions in a program use one of the seven pending subroutine returns in the calculator. (Refer to "Nested Subroutines" in chapter 13.)

The SOLVE and $\int$ FN operations automatically set Decimal display format.

## 15

## Mathematics Programs

## Vector Operations

This program performs the basic vector operations of addition, subtraction, cross product, and dot (or scalar) product. The program uses three-dimensional vectors and provides input and output in rectangular or polar form. Angles between vectors can also be found.

This program uses the following equations. Coordinate conversion:

$$
\begin{array}{ll}
X=R \sin (P) \cos (T) & R=\sqrt{X^{2}+Y^{2}+Z^{2}} \\
Y=R \sin (P) \sin (T) & T=\arctan (Y / X) \\
Z=R \cos (P) & P=\arctan \frac{Z}{\sqrt{X^{2}+Y^{2}}}
\end{array}
$$

Vector addition and subtraction:

$$
\begin{aligned}
& \mathbf{v}_{1}+\mathbf{v}_{2}=(X+U) \mathbf{i}+(Y+V) \mathbf{i}+(Z+W) \mathbf{k} \\
& \mathbf{v}_{2}-\mathbf{v}_{1}=(U-X) \mathbf{i}+(V-Y) \mathbf{i}+(W-Z) \mathbf{k}
\end{aligned}
$$

Cross product:

$$
\mathbf{v}_{1} \times \mathbf{v}_{2}=(Y W-Z V) \mathbf{i}+(Z U-X W) \mathbf{i}+(X V-Y U) \mathbf{k}
$$

Dot Product:

$$
D=X U+Y V+Z W
$$

Angle between vectors $(\gamma)$ :

$$
G=\arccos \frac{D}{R_{1} \times R_{2}}
$$

where
$\mathbf{v}_{1}=X \mathbf{i}+Y \mathbf{i}+Z \mathbf{k}$
and
$\mathbf{v}_{2}=U \mathbf{i}+V \mathbf{i}+W \mathbf{k}$
The vector displayed by the input routines (LBL P and LBL R) is $V_{7}$.

DG018 RCL
[0019y:x $\rightarrow \theta$ : Calculates the magnitude of the $U, V, W$ vector.
[0020 5T0 E
[0021 (
[0022 RCL
$00023 \mathrm{RCL} \div \mathrm{R} \quad$ Divides the dot product by the magnitude of the $X$-, $Y$-, Z-vector.
[0024: Divides previous result by the magnitude.
D0025 RCL E
[0026)
00027 RC0s Calculates angle.
D日628 5T0
D0029 VIENG Displays angle.
[0030 GTO F Loops back for polar display/input.
Checksum and length: 054890

## Flags Used:

None.

## Remarks:

The terms "polar" and "rectangular," which refer to two-dimensional systems, are used instead of the proper three-dimensional terms of "spherical" and "Cartesian." This stretch of terminology allows the labels to be associated with their function without confusing conflicts. For instance, if LBL C had been associated with Cartesian coordinate input, it would not have been available for cross product.

## Program Instructions:

1. Key in the program routines; press $\mathbf{C}$ when done.
2. If your vector is in rectangular form, press XEQ $R$ and go to step 4. If your vector is in polar form, press XEQ $P$ and continue with step 3.
3. Key in $R$ and press R/S, key in $T$ and press R/S, then key in $P$ and press R/S. Continue at step 5.
4. Key in $X$ and press R/S, key in $Y$ and press R/S, and key in $Z$ and press R/S.
5. To key in a second vector, press XEQ E (for enter), then go to step 2 .
6. Perform desired vector operation:
a. Add vectors by pressing XEQ A;
b. Subtract vector one from vector two by pressing XEQ $S$;
c. Compute the cross product by pressing $X E Q$;
d. Compute the dot product by pressing XEQ $D$ and the angle between vectors by pressing $\mathrm{R} / \mathbf{S}$.
7. Optional: to review $\mathrm{v}_{1}$ in polar form, press XEQ $P$, then press $\mathrm{R} / \mathrm{S}$ repeatedly to see the individual elements.
8. Optional: to review $\mathrm{v}_{1}$ in rectangular form, press XEQ $R$, then press $R / S$ repeatedly to see the individual elements.
9. If you added, subtracted, or computed the cross product, $\mathbf{v}_{1}$ has been replaced by the result, $\mathbf{v}_{2}$ is not altered. To continue calculations based on the result, remember to press XEQ E before keying in a new vector.
10. Go to step 2 to continue vector calculations.

## Variables Used:

| $X, Y, Z$ | The rectangular components of $\mathbf{v}_{1}$. |
| :--- | :--- |
| $U, V, W$ | The rectangular components of $\mathbf{v}_{2}$. |
| $R, T, P$ | The radius, the angle in the $x-y$ plane $(\theta)$, and the angle from |
| the $Z$ axis of $\mathbf{v}_{1}$ (U). |  |
| D | The dot product |
| $G$ | The angle between vectors $(\gamma)$ |

## Example 1:

A microwave antenna is to be pointed at a transmitter which is 15.7 kilometers North, 7.3 kilometers East and 0.76 kilometers below. Use the rectangular to polar conversion capability to find the total distance and the direction to the transmitter.

## Keys: <br> (In ALG mode) <br> (l)

## Solutions of Simultaneous Equations

This program solves simultaneous linear equations in two or three unknowns. It does this through matrix inversion and matrix multiplication.

A system of three linear equations

$$
\begin{gathered}
A X+D Y+G Z=J \\
B X+E Y+H Z=K \\
C X+F Y+I Z=L
\end{gathered}
$$

can be represented by the matrix equation below.

$$
\left[\begin{array}{lll}
A & D & G \\
B & E & H \\
C & F & I
\end{array}\right]\left[\begin{array}{l}
X \\
Y \\
Z
\end{array}\right]=\left[\begin{array}{c}
J \\
K \\
L
\end{array}\right]
$$

The matrix equation may be solved for $X, Y$, and $Z$ by multiplying the result matrix by the inverse of the coefficient matrix.

$$
\left[\begin{array}{lll}
A^{\prime} & D^{\prime} & G^{\prime} \\
B^{\prime} & E^{\prime} & H^{\prime} \\
C^{\prime} & F^{\prime} & I^{\prime}
\end{array}\right]\left[\begin{array}{c}
J \\
K \\
L
\end{array}\right]=\left[\begin{array}{l}
X \\
Y \\
Z
\end{array}\right]
$$

Specifics regarding the inversion process are given in the comments for the inversion routine, I.

Checksum and length： 795775

## Flags Used：

None．

## Program Instructions:

1. Key in the program routines; press $C$ when done.
2. Press XEQ $A$ to input coefficients of matrix and column vector.
3. Key in coefficient or vector value (A through L ) at each prompt and press $\mathrm{R} / \mathrm{S}$.
4. Optional: press XEQ $D$ to compute determinant of $3 \times 3$ system.
5. Press $\triangle E Q$ lo compute inverse of $3 \times 3$ matrix.
6. Optional: press XEQ A and repeatedly press R/S to review the values of the inverted matrix.
7. Press XEQ $M$ to multiply the inverted matrix by the column vector and to see the value of $X$. Press $R / \mathbf{S}$ to see the value of $Y$, then press $R / \mathbf{R}$ again to see the value of $Z$.
8. For a new case, go back to step 2 .

## Variables Used:

| A through I | Coefficients of matrix. |
| :--- | :--- |
| J through L | Column vector values. |
| W | Scratch variable used to store the determinant. <br> Othrough $Z$ |
| Output vector values; also used for scatch. <br> i Loop-control value (index variable); also used for <br> scratch. |  |

## Remarks:

For $2 \times 2$ solutions use zero for coefficients $C, F, H, G$ and for $L$. Use 1 for coefficient $l$.

Not all systems of equations have solutions.

## Example:

For the system below, compute the inverse and the system solution. Review the inverted matrix. Invert the matrix again and review the result to make sure that the original matrix is returned.

$$
\begin{gathered}
23 X+15 Y+17 Z=31 \\
8 X+11 Y-6 Z=17 \\
4 X+15 Y+12 Z=14
\end{gathered}
$$

|  | 8.0006 |  |
|  | $\stackrel{\square}{\bullet}$ |  |
|  | - |  |

## Polynomial Root Finder

This program finds the roots of a polynomial of order 2 through 5 with real coefficients. It calculates both real and complex roots.

For this program, a general polynomial has the form

$$
x^{n}+a_{n-1} 1 x^{n-1}+\ldots+a_{1} x+a_{0}=0
$$

where $\mathrm{n}=2,3,4$, or 5 . The coefficient of the highest-order term $\left(a_{n}\right)$ is assumed to be 1 . If the leading coefficient is not 1 , you should make it 1 by dividing all the coefficients in the equation by the leading coefficient. (See example 2.)

The routines for third- and fifth-order polynomials use SOLVE to find one real root of the equation, since every odd-order polynomial must have at least one real root. After one root is found, synthetic division is performed to reduce the original polynomial to a second- or fourth-order polynomial.

To solve a fourth-order polynomial, it is first necessary to solve the resolvant cubic polynomial:

$$
y^{3}+b_{2} y^{2}+b_{1} y+b_{0}=0
$$

where $b_{2}=-a_{2}$
$b_{1}=a_{3} a_{1}-4 a_{0}$
$b_{0}=a_{0}\left(4 a_{2}-a_{3}^{2}\right)-a_{1}^{2}$.
Let yo be the largest real root of the above cubic. Then the fourth-order polynomial is reduced to two quadratic polynomials:

$$
\begin{aligned}
& x^{2}+(J+L) x+(K+M)=0 \\
& x^{2}+(J-L) x+(K-M)=0
\end{aligned}
$$

where $J=a_{3} / 2$
$K=y 0 / 2$
$L=\sqrt{J^{2}-a_{2}+y_{0}} \times\left(\right.$ the sign of $\left.J K-a_{1} / 2\right)$
$M=\sqrt{K^{2}-a_{0}}$
Roots of the fourth degree polynomial are found by solving these two quadratic polynomials.

A quadratic equation $x^{2}+a_{1} x+a_{0}=0$ is solved by the formula

$$
x_{1,2}=-\frac{a_{1}}{2} \pm \sqrt{\left(\frac{a_{1}}{2}\right)^{2}-a_{0}}
$$

If the discriminant $d=\left(a_{1} / 2\right)^{2}-a_{0} \geq 0$, the roots are real; if $d<0$, the roots are complex, being $u \pm i v=-\left(a_{1} / 2\right) \pm i \sqrt{-d}$.

| $906+$ - | Generates the imaginary part of the second complex root. |
| 7 STo | Stores the imaginary part of the second complex root. |
| U000s VIEW | Displays the imaginary part of the second complex |

Checksum and length: 748D 24

## Flags Used:

Flag 0 is used to remember if the root is real or complex (that is, to remember the sign of $d$ ). If $d$ is negative, then flag 0 is set. Flag 0 is tested later in the program to assure that both the real and imaginary parts are displayed if necessary.

## Remarks:

The program accommodates polynomials of order 2, 3, 4, and 5 . It does not check if the order you enter is valid.

The program requires that the constant term $a_{0}$ is nonzero for these polynomials. (If $a_{0}$ is 0 , then 0 is a real root. Reduce the polynomial by one order by factoring out x.)

The order and the coefficients are not preserved by the program.

Because of round-off error in numerical computations, the program may produce values that are not true roots of the polynomial. The only way to confirm the roots is to evaluate the polynomial manually to see if it is zero at the roots.

For a third- or higher-order polynomial, if SOLVE cannot find a real root, the error DIVIDE BYE is displayed.

You can save time and memory by omitting routines you don't need. If you're not solving fifth-order polynomials, you can omit routine E. If you're not solving fourthor fifth-order polynomials, you can omit routines D, E, and F. If you're not solving third-, fourth-, or fifth-order polynomials, you can omit routines C, D, E, and F.

## Program Instructions:

1. Press $⿴ 囗$ CLEAR $\{P L L\}$ to clear all programs and variables.
2. Key in the program routines; press $[\mathbf{C}$ when done.
3. Press $X E Q P$ to start the polynomial root finder.
4. Key in $F$, the order of the polynomial, and press $R / S$
5. At each prompt, key in the coefficient and press R/S. You're not prompted for the highest-order coefficient - it's assumed to be 1 . You must enter 0 for coefficients that are 0 . Coefficient A must not be 0 .

|  | Terms and Coefficients |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Order | $x^{5}$ | $x^{4}$ | $x^{3}$ | $x^{2}$ | $x$ | Constant |
| 5 | 1 | $E$ | $D$ | $C$ | $B$ | $A$ |
| 4 |  | 1 | $D$ | $C$ | $B$ | $A$ |
| 3 |  |  | 1 | $C$ | $B$ | $A$ |
| 2 |  |  |  | 1 | $B$ | $A$ |

6. After you enter the coefficients, the first root is calculated. A real root is displayed as $X=$ real value. A complex root is displayed as $X=$ real part, (Complex roots always occur in pairs of the form $u \pm i v$, and are labeled in the output as $\mathrm{X}=$ real part and $\mathrm{i}=$ imaginary part, which you'll see in the next step.)
7. Press $\mathbb{R} / \mathbf{S}$ repeatedly to see the other roots, or to see $i=$ imaginary part, the imaginary part of a complex root. The order of the polynomial is same as the number of roots you get.
8. For a new polynomial, go to step 3 .

| A through E | Coefficients of polynomial; scratch. |
| :--- | :--- |
| $F$ | Order of polynomial; scratch. |
| $G$ | Scratch. |
| $H$ | Pointer to polynomial coefficients. |
| $X$ | The value of a real root, or the real part of complex root <br> i |
| The imaginary part of a complex root; also used as an index <br> variable. |  |

## Example 1:

Find the roots of $x^{5}-x^{4}-101 x^{3}+101 x^{2}+100 x-100=0$.

| Keys: (In RPN mode) | Display: | Description: |
| :---: | :---: | :---: |
| XEQ $P$ | F? value | Starts the polynomial root finder; prompts for order. |
| 5 R/S | E? value | Stores 5 in F; prompts for $E$. |
| 1 + R/S | [? <br> value | Stores -1 in E; prompts for D. |
| 101 + R/S | 0 ? value | Store - 101 in D. prompts for $C$. |
| 101 R/S | B? <br> value | Stores 101 in $C$; prompts for $B$. |
| $100 \mathrm{R} / \mathrm{S}$ | A? value | Stores 100 in $B$; prompts for $A$. |
| 100 + R/S | $\begin{aligned} & x= \\ & 1 \cdot 0000 \end{aligned}$ | Stores -100 in $A$; calculates the first root. |
| R/S | $\begin{aligned} & x= \\ & -10.00000 \end{aligned}$ | Calculates the second root. |
| R/S | $\begin{aligned} & x= \\ & -1.0000 \end{aligned}$ | Displays the third root. |
| R/S | $\begin{aligned} & x= \\ & 1 \cdot 0000 \end{aligned}$ | Displays the fourth root. |
| R/S | $\begin{aligned} & x= \\ & 10.0000 \end{aligned}$ | Displays the fifth root. |

## Example 2:

Find the roots of $4 x^{4}-8 x^{3}-13 x^{2}-10 x+22=0$. Because the coefficient of the highest-order term must be 1, divide that coefficient into each of the other coefficients.

| Keys: <br> (In RPN mode) | Display: | Description: |

| 6 +/-R/S | $\mathrm{x}=$ | Stores -6 in A; calculates the first |
|  | -3.0060 | root. |
| R/S | $x=$ | Calculates the second root. |
|  | 2.0600 |  |

## Coordinate Transformations

This program provides two-dimensional coordinate translation and rotation.
The following formulas are used to convert a point $P$ from the Cartesian coordinate pair $(x, y)$ in the old system to the pair $(u, v)$ in the new, translated, rotated system.

$$
\begin{aligned}
& u=(x-m) \cos \theta+(y-n) \sin \theta \\
& v=(y-n) \cos \theta-(x-m) \sin \theta
\end{aligned}
$$

The inverse transformation is accomplished with the formulas below.

$$
\begin{aligned}
& x=u \cos \theta-v \sin \theta+m \\
& y=u \sin \theta+v \cos \theta+n
\end{aligned}
$$

The HP 33s complex and polar-to-rectangular functions make these computations straightforward.

## Program Listing：

## Program Lines： （In RPN mode）

## Description

［0001 LBL D This routine defines the new coordinate system．

［0003 I I FFUT $\ddagger$ Prompts for and stores $N$ ，the new origin＇s $y$－coordinate．
00004 IHFUT T Prompts for and stores $T$ ，the angle $\theta$ ． D0005 ETO LI Loops for review of inputs． Checksum and length：1EDA 15
H 001 LEL H This routine converts from the old system to the new
system．

H0002 IHFUT X Prompts for and stores $X$ ，the old $x$－coordinate．
N0003 IFPUT $Y$ Prompts for and stores $Y$ ，the old $y$－coordinate．
N0004 RCL $X \quad$ Pushes $Y$ up and recalls $X$ to the $X$－register．
H0605 RCL $H \quad$ Pushes $X$ and $Y$ up and recalls $N$ to the $X$－register．
HE006 RCLM Pushes $N, X$ ，and $Y$ up and recalls $M$ ．
H0607 CMFLX－Calculates $(X-M)$ and $(Y-N)$ ．
N0008 RCL T Pushes $(X-M)$ and $(Y-N)$ up and recalls $T$ ．
ト日009＋$\quad$－
トब010 1

$00015 \times<>y$ Swaps the positions of the coordinates back.
00016 VIEU $X$ Halts the program to display $X$.
0017 UIEW $Y$ Halts the program to display $Y$.
00018 ETO $0 \quad$ Goes back for another calculation.
Checksum and length: 8C82 66

## Flags Used:

None.

## Program Instructions:

1. Key in the program routines; press $[\mathbf{C}$ when done.
2. Press XEQ D to start the prompt sequence which defines the coordinate transformation.
3. Key in the $x$-coordinate of the origin of the new system $M$ and press $R / S$.
4. Key in the $y$-coordinate of the origin of the new system $N$ and press $R / \mathbf{S}$
5. Key in the rotation angle $T$ and press $R / S$.
6. To translate from the old system to the new system, continue with step 7. To translate from the new system to the old system, skip to step 12.
7. Press XEQ N to start the old-to-new transformation routine.
8. Key in $X$ and press R/S.
9. Key in $Y$, press R/S, and see the $x$-coordinate, $U$, in the new system.
10. Press R/S and see the $y$-coordinate, $V$, in the new system.
11. For another old-to-new transformation, press $R / S$ and go to step 8 . For a new-to-old transformation, continue with step 12.
12. Press XEQ O to start the new-to-old transformation routine.
13. Key in $U$ (the $x$-coordinate in the new system) and press $R / S$.
14. Key in $V$ (the $y$-coordinate in the new system) and press $\mathrm{R} / \mathrm{S}$ to see $X$.
15. Press $\mathbb{R / S}$ to see $Y$.
16. For another new-to-old transformation, press $R / S$ and go to step 13. For an old-to-new transformation, go to step 7.

## Variables Used:

$M \quad$ The $x$-coordinate of the origin of the new system.

N
T
$X$
Y
U
V

The $y$-coordinate of the origin of the new system. The rotation angle, $\theta$, between the old and new systems. The $x$-coordinate of a point in the old system. The $y$-coordinate of a point in the old system. The $x$-coordinate of a point in the new system. The $y$-coordinate of a point in the new system.

## Remark:

For translation only, key in zero for $T$. For rotation only, key in zero for $M$ and $N$.

## Example:

For the coordinate systems shown below, convert points $P_{1}, P_{2}$ and $P_{3}$, which are currently in the $\left(X, Y\right.$ ) system, to points in the $\left(X^{\prime}, Y^{\prime}\right)$ system. Convert point $P^{\prime}{ }_{4}$, which is in the $\left(X^{\prime}, Y^{\prime}\right)$ system, to the $(X, Y)$ system.

## 16

## Statistics Programs

## Curve Fitting

This program can be used to fit one of four models of equations to your data. These models are the straight line, the logarithmic curve, the exponential curve and the power curve. The program accepts two or more ( $x, y$ ) data pairs and then calculates the correlation coefficient, $r$, and the two regression coefficients, $m$ and b. The program includes a routine to calculate the estimates $\hat{x}$ and $\hat{y}$. (For definitions of these values, see "Linear Regression" in chapter 11.)

Samples of the curves and the relevant equations are shown below. The internal regression functions of the HP 33s are used to compute the regression coefficients.

To fit logarithmic curves, values of $x$ must be positive. To fit exponential curves, values of $y$ must be positive. To fit power curves, both $x$ and $y$ must be positive. A $\operatorname{LOG}(\mathbb{H E G})$ error will occur if a negative number is entered for these cases.

Data values of large magnitude but relatively small differences can incur problems of precision, as can data values of greatly different magnitudes. Refer to "Limitations in Precision of Data" in chapter 11.

## Program Listing:

## Program Lines: <br> (In RPN mode)

| 0001 LBL 5 | This routine sets, the status for the straight-line model. |

## 16－6 Statistics Programs

## Program Lines: <br> (In RPN mode)

## Description

DG063 RCL M
$00004 y^{8}$
[10005 RCLX E Calculates $Y=B(X M)$.
D0066 RTH Returns to the calling routine.
Checksum and length: 018C 18
J0601 LELJ This subroutine calculates $\hat{X}$ for the power model.
T0002 ST0- i Restores index value to its original value.
J $060 \mathrm{RCL} Y$
J0004 RCL $\div \mathrm{B}$
J 0605 RCL M
J $06061 / x$
J0067 $\boldsymbol{y}^{X} \quad$ Calculates $\hat{x}=(Y / B)^{1 / M}$
$\mathrm{T} 000 \mathrm{RTH} \quad$ Returns to the calling routine.
Checksum and length: 304024

## Flags Used:

Flag 0 is set if a natural log is required of the $X$ input. Flag 1 is set if a natural log is required of the $Y$ input.

## Program instructions:

1. Key in the program routines; press $\mathbf{C}$ when done.
2. Press XEQ and select the type of curve you wish to fit by pressing:

- $S$ for a straight line;
- L for a logarithmic curve;
- E for an exponential curve; or
- P for a power curve.

3. Key in $x$-value and press R/S.
4. Key in $y$-value and press R/S.
5. Repeat steps 3 and 4 for each data pair. If you discover that you have made an error after you have pressed R/S in step 3 (with the $Y ?$ value prompt still visible), press R/S again (displaying the X ? value prompt) and press XEQ U to undo (remove) the last data pair. If you discover that you made an error after step 4, press XEQ U. In either case, continue at step 3.
6. After all data are keyed in, press XEQ R to see the correlation coefficient, $R$.
7. Press $R / \mathbf{S}$ to see the regression coefficient $B$.
8. Press $R / S$ to see the regression coefficient $M$.
9. Press $\mathrm{R} / \mathrm{S}$ to see the $\hat{x} ?$ value prompt for the $\hat{x}, \hat{y}$-estimation routine.
10. If you wish to estimate $\hat{y}$ based on $x$, key in $x$ at the $\hat{X} ?$ value prompt, then press R/S to see $\hat{y}$ (Y?).
11. If you wish to estimate $\hat{x}$ based on $y$, press $R / S$ until you see the $Y$ ? value prompt, key in $y$, then press $R / \mathbf{S}$ to see $\hat{x}$ ( $(x)$ ).
12. For more estimations, go to step 10 or 11 .
13. For a new case, go to step 2.

## Variables Used:

B

M
R
X

Y
i

Statistics registers

Regression coefficient ( $y$-intercept of a straight line); also used for scratch.

Regression coefficient (slope of a straight line).
Correlation coefficient; also used for scratch.
The $x$-value of a data pair when entering data; the hypothetical $x$ when projecting $\hat{y}$; or $\hat{x}$ ( $x$-estimate) when given a hypothetical $y$.
The $y$-value of a data pair when entering data; the hypothetical $y$ when projecting $\hat{x}$; or $\hat{y}$ (y-estimate) when given a hypothetical $x$.
Index variable used to indirectly address the correct $\hat{x}-, \hat{y}$-projection equation.
Statistical accumulation and computation.

## Example 1:

Fit a straight line to the data below. Make an intentional error when keying in the third data pair and correct it with the undo routine. Also, estimate $y$ for an $x$ value of 37 . Estimate $x$ for a $y$ value of 101 .

| X | 40.5 | 38.6 | 37.9 | 36.2 | 35.1 |
| :--- | :--- | :--- | :--- | :--- | :--- |$\quad 34.6$

Now intentionally enter 379 instead of 37.9 so that you can see how to correct incorrect entries.

| Keys: | Display: | Description: |
| :---: | :--- | :--- |
| (In RPN mode) |  |  |

| 379 R/S | $Y ?$ | Enters wrong $x$-value of data |
| :---: | :---: | :---: |
|  | 102.0060 | pair. |
| R/S | X? | Retrieves $\mathbb{X} ?$ prompt. |
|  | 4.0606 |  |
| XEQ U | X? | Deletes the last pair. Now proceed with the correct data entry. |
|  | 3.0606 |  |
| 37.9 R/S | $Y$ ? | Enters correct $x$-value of data pair. |
|  | 102.0006 |  |

| $100 \mathrm{R} / \mathrm{S}$ | 87 | Enters $y$-value of data pair. |
| :---: | :---: | :---: |
|  | 4.6006 |  |
| 36.2 R/S | Y? | Enters $x$-value of data pair. |
|  | 100.0606 |  |
| $97.5 \mathrm{R} / \mathrm{S}$ | $x$ ? | Enters $y$-value of data pair. |
|  | 5.0060 |  |
| 35.1 R/S | $Y ?$ | Enters $x$-value of data pair. |
|  | 97.5060 |  |
| $95.5 \mathrm{R} / \mathrm{S}$ | $x ?$ | Enters $y$-value of data pair. |
|  | 6.6006 |  |
| $34.6 \mathrm{R} / \mathrm{S}$ | Y? | Enters $x$-value of data pair. |
|  | 95.5060 |  |
| $94 \mathrm{R} / \mathrm{S}$ | 8 ? | Enters $y$-value of data pair. |
|  | 7.0006 |  |
| XEQ R |  | Calculates the correlation |
|  | 0.9955 | coefficient. |
| R/S | $\mathrm{E}=$ | Calculates regression coefficient |
|  | 33.5271 | B. |
| R/S | $\mathrm{M}=$ | Calculates regression coefficient |
|  | 1.7601 | M. |
| R/S | X? | Prompts for hypothetical $x$-value. |
|  | 7.0006 |  |
| $37 \mathrm{R} / \mathrm{S}$ | Y? | Stores 37 in $X$ and calculates $\hat{Y}$. |
|  | 98.6526 |  |
| 101 R/S | $x ?$ | Stores 101 in Y and calculates |
|  | 38.3336 |  |

## Example 2:

Repeat example 1 (using the same data) for logarithmic, exponential, and power curve fits. The table below gives you the starting execution label and the results (the correlation and regression coefficients and the $x$ - and $y$ - estimates) for each type of curve. You will need to reenter the data values each time you run the program for a different curve fit.

|  | Logarithmic | Exponential | Power |
| :---: | :---: | :---: | :---: |
| To start: | $X E Q ~ L$ | $X E Q ~ E$ | $X E Q ~ P$ |

## Normal and Inverse-Normal Distributions

Normal distribution is frequently used to model the behavior of random variation about a mean. This model assumes that the sample distribution is symmetric about the mean, $M$, with a standard deviation, $S$, and approximates the shape of the bell-shaped curve shown below. Given a value $x$, this program calculates the probability that a random selection from the sample data will have a higher value. This is known as the upper tail area, $Q(x)$. This program also provides the inverse: given a value $Q(x)$, the program calculates the corresponding value $x$.

$$
Q(x)=0.5-\frac{1}{\sigma \sqrt{2 \pi}} \int_{\bar{x}}^{x} e^{-((x-\bar{x})+\sigma)^{2}+2} d x
$$

This program uses the built-in integration feature of the HP 33s to integrate the equation of the normal frequency curve. The inverse is obtained using Newton's method to iteratively search for a value of $x$ which yields the given probability $Q(x)$.

## Program Listing:

Program Lines: (In RPN mode)

S0001 LBL 5 This routine initializes the normal distribution program.
S0062 0 Stores default value for mean.
S0063 STOM
S0004 IHFUTM Prompts for and stores mean, $M$.
500051 Stores default value for standard deviation.

S0007 IHPUTS Prompts for and stores standard deviation, $S$.
S0008 RTH $\quad$ Stops displaying value of standard deviation.
[0001 LEL $\mathrm{D} \quad$ This routine calculates $Q(X)$ given $X$.
D0002 I $\mathrm{HFHT} X \quad$ Prompts for and stores $X$.
[10603 KEQ XE Calculates upper tail area.
00004 ST0 $Q \quad$ Stores value in $Q$ so VIEW function can display it.
[10055 VIENQ Displays $Q(X)$.
D0066 GTO Loops to calculate another $Q(X)$.
Checksum and length: EA54 18
I 0001 LEL I This routine calculates $X$ given $Q(X)$.
I 0062 INFUT Q Prompts for and stores $Q(X)$.
I 0003 RCL M Recalls the mean.
I 0004 ST0 $X \quad$ Stores the mean as the guess for $X$, called $X_{\text {guess }}$.
Checksum and length: 79B9 12
T0001 LEL T This label defines the start of the iterative loop.
T0002 XEQQ Calculates $\left(Q\left(X_{\text {guess }}\right)-Q(X)\right.$ ).
TQD日3 RCL-Q
TG004 RCL X
T0005 STO
T6066 R $\downarrow$
TE067 XEQ F $\quad$ Calculates the derivative at $X_{\text {guess }}$.
TG008 RCL $\div T$
T0009 -
Calculates the correction for $X_{\text {guess }}$.

## Program Lines: (In RPN mode)

## Description

T0010 STO+ $X \quad$ Adds the correction to yield a new $X_{\text {guess }}$.
T0011 RES
T00120.0001
T0013 $x<y ?$ Tests to see if the correction is significant.
T0014 ET0 T Goes back to start of loop if correction is significant. Continues if correction is not significant.
T0015 RCL X
TQU16 VIEW $X$ Displays the calculated value of $X$.
TE日17 GTO L Loops to calculate another $X$.
Checksum and length: OE12 63

Q0001 LEL Q This subroutine calculates the upper-tail area $Q(x)$.
Q0002 RCL M Recalls the lower limit of integration.
Q0003 RCL $X$ Recalls the upper limit of integration.
Q0004 FH=F Selects the function defined by LBL F for integration.
Q0005 $\int \mathrm{FH} \& \mathrm{D}$ Integrates the normal function using the dummy variable D.

000062
Q0007 $\pi$
Q0608 $\times$
Q6069 $\sqrt{x}$
Q0010 RCL× 5 Calculates $S \times \sqrt{2 \pi}$.
Q0011 ST0 T Stores result temporarily for inverse routine.
Q0012 $\div$
Q6013 + -
Q6014. 5
Q0015 + Adds half the area under the curve since we integrated using the mean as the lower limit.
Q0016 RTH Returns to the calling routine.
Checksum and length: FA83 72
F0001 LEL F This subroutine calculates the integrand for the normal function $e^{-((X-M) \div S)^{2} \div 2}$
Fgoge RCL
F0063 RCL-M

## Program Lines: <br> (In RPN mode)

## Description

F0004 RCL $\div 5$
F0005 $x^{2}$
F0006 2
F0007 -
F0008 + $/-$
F0009 $\mathrm{e}^{\mathrm{X}}$
F0010 RTN Returns to the calling routine.
Checksum and length: 198142

Flags Used:
None.

## Remarks:

The accuracy of this program is dependent on the display setting. For inputs in the area between $\pm 3$ standard deviations, a display of four or more significant figures is adequate for most applications.

At full precision, the input limit becomes $\pm 5$ standard deviations. Computation time is significantly less with a lower number of displayed digits.

In routine $Q$, the constant 0.5 may be replaced by 2 and $1 / x$.
You do not need to key in the inverse routine (in routines I and T) if you are not interested in the inverse capability.

## Program Instructions:

1. Key in the program routines; press $C$ when done.
2. Press $X E Q S$.
3. After the prompt for $M$, key in the population mean and press $\mathbb{R} / \mathbf{S}$. (If the mean is zero, just press R/S.)
4. After the prompt for $S$, key in the population standard deviation and press R/S. (If the standard deviation is 1 , just press $R / \mathbf{S}$.)
5. To calculate $X$ given $Q(X)$, skip to step 9 of these instructions.
6. To calculate $Q(X)$ given $X, X E Q$.
7. After the prompt, key in the value of $X$ and press R/S. The result, $Q(X)$, is displayed.
8. To calculate $Q(X)$ for a new $X$ with the same mean and standard deviation, press $R / \mathbf{S}$ and go to step 7 .
9. To calculate $X$ given $Q(X)$, press $X E Q$.
10. After the prompt, key in the value of $Q(X)$ and press $R / S$. The result, $X$, is displayed.
11. To calculate $X$ for a new $Q(X)$ with the same mean and standard deviation, press $R / \mathbf{S}$ and go to step 10 .

## Variables Used:

D Dummy variable of integration.
M Population mean, default value zero.
Q Probability corresponding to the upper-tail area.
$S \quad$ Population standard deviation, default value of 1 .
$T \quad$ Variable used temporarily to pass the value $S \times \sqrt{2 \pi}$ to the inverse program.
$X \quad$ Input value that defines the left side of the upper-tail area.

## Example 1:

Your good friend informs you that your blind date has " $3 \sigma$ " intelligence. You interpret this to mean that this person is more intelligent than the local population except for people more than three standard deviations above the mean.

Suppose that you intuit that the local population contains 10,000 possible blind dates. How many people fall into the " $3 \sigma$ " band? Since this problem is stated in terms of standard deviations, use the default value of zero for $M$ and 1 for $S$.

| Keys: <br> (In RPN mode) | Display: | Description: |
| :---: | :---: | :---: |
| XEQ S | M? | Starts the initialization routine. |
|  | 0.0000 |  |
| R/S | 5 ? | Accepts the default value of zero for |
|  | 1.0000 | M. |
| R/S | 1.0000 | Accepts the default value of 1 for $S$. |

| XEQ D | $x ?$ <br> value | Starts the distribution program and prompts for $X$. |
| :---: | :---: | :---: |
| $3 \mathrm{R} / \mathrm{S}$ | Q= | Enters 3 for $X$ and starts computation |
|  | 0.0013 | of $Q(X)$. Displays the ratio of the population smarter than everyone within three standard deviations of the mean. |
| $10000 \times$ | 13.4984 | Multiplies by the population. |
|  |  | Displays the approximate number of blind dates in the local population that meet the criteria. |

Since your friend has been known to exaggerate from time to time, you decide to see how rare a " $2 \sigma$ " date might be. Note that the program may be rerun simply by pressing R/S.

| Keys: | Display: |
| :---: | :--- |
| (In RPN mode) |  |

| R/S | $8 ?$ | Resumes program. |
| :---: | :---: | :---: |
|  | 3.0006 |  |
| 2 R/S | Q= | Enters $X$-value of 2 and calculates |
|  | 0.0228 | $Q(X)$. |
| $10000 \times$ | 227.5012 | Multiplies by the population for the |
|  |  | revised estimate. |

## Example 2:

The mean of a set of test scores is 55 . The standard deviation is 15.3 . Assuming that the standard normal curve adequately models the distribution, what is the probability that a randomly selected student scored at least 90 ? What is the score that only 10 percent of the students would be expected to have surpassed? What would be the score that only 20 percent of the students would have failed to achieve?

## Keys: (In RPN mode)

Display:

M?
0.0000

| 55 R/S | $5 ?$ | Stores 55 for the mean. |
| :---: | :---: | :---: |
|  | 1.0000 |  |
| 15.3 R/S | 15.3000 | Stores 15.3 for the standard deviation. |
| XEQ D | $x ?$ value | Starts the distribution program and prompts for $X$. |
| 90 R/S | $Q=$ | Enters 90 for $X$ and calculates $Q(X)$. |
|  | 0.0111 |  |

Thus, we would expect that only about 1 percent of the students would do better than score 90.

| Keys: $\quad$ Display: | Description: |
| :---: | :--- |

XEQ I
$0.1 \mathrm{R} / \mathrm{S}$

R/S
0.8 R/S
$\mathrm{x}=$
42.1232

Starts the inverse routine.

Stores 0.1 (10 percent) in $Q(X)$ and calculates $X$.

Resumes the inverse routine.

Stores 0.8 ( 100 percent minus 20
percent) in $Q(X)$ and calculates $X$.

## Grouped Standard Deviation

The standard deviation of grouped data, $S_{x y}$, is the standard deviation of data points $x_{1}, x_{2}, \ldots, x_{n}$, occurring at positive integer frequencies $f_{1}, f_{2}, \ldots, f_{n}$.

$$
S_{x g}=\sqrt{\frac{\sum x_{i}^{2} f_{i}-\frac{\left(\sum x_{i} f_{i}\right)^{2}}{\sum f_{i}}}{\left(\sum f_{i}\right)-1}}
$$

This program allows you to input data, correct entries, and calculate the standard deviation and weighted mean of the grouped data.

## 17

## Miscellaneous Programs and Equations

## Time Value of Money

Given any four of the five values in the "Time-Value-of-Money equation" (TVM), you can solve for the fifth value. This equation is useful in a wide variety of financial applications such as consumer and home loans and savings accounts.

The TVM equation is:

$$
P\left[\frac{1-(1+1 / 100)^{-N}}{I / 100}\right]+F(1+(1 / 100))^{-N}+B=0
$$

The signs of the cash values (balance, $B$; payment, $P$; and future balance, $F$ ) correspond to the direction of the cash flow. Money that you receive has a positive sign while money that you pay has a negative sign. Note that any problem can be viewed from two perspectives. The lender and the borrower view the same problem with reversed signs.

## Equation Entry：

Key in this equation：

$$
P \times 100 \times(1-(1+I \div 100) \wedge-H) \div I+F \times(1+I \div 160) \wedge-H+B
$$

## Keys： （In RPN mode）

Description：

Selects Equation mode．

Starts entering equation．

Terminates the equation．
Checksum and length．

## Remarks：

The TVM equation requires that $I$ must be non－zero to avoid a DIVIDE BY＇${ }^{6}$ error．If you＇re solving for I and aren＇t sure of its current value，press 1 STO I before you begin the SOLVE calculation（SOLVE I ）．

The order in which you＇re prompted for values depends upon the variable you＇re solving for．

## SOLVE instructions:

1. If your first TVM calculation is to solve for interest rate, I, press 1 STO I.
2. Press $\square$ EQN. If necessary, press $\uparrow$ or $\downarrow$ to scroll through the equation list until you come to the TVM equation.
3. Do one of the following five operations:
a. Press SOLVE N to calculate the number of compounding periods.
b. Press SOLVE I to calculate periodic interest.

For monthly payments, the result returned for $I$ is the monthly interest rate, $i$; press $12 \quad x$ to see the annual interest rate.
c. Press SOLVE B to calculate initial balance of a loan or savings account.
d. Press SOLVE $P$ to calculate periodic payment.
e. Press SOLVE F to calculate future value or balance of a loan.
4. Key in the values of the four known variables as they are prompted for; press R/S] after each value.
5. When you press the last R/S, the value of the unknown variable is calculated and displayed.
6. To calculate a new variable, or recalculate the same variable using different data, go back to step 2.

SOLVE works effectively in this application without initial guesses.

## Variables Used:

| $N$ | The number of compounding periods. <br> The periodic interest rate as a percentage. (For example, if the <br> annual interest rate is $15 \%$ and there are 12 payments per year, |
| :--- | :--- |
| the periodic interest rate, $i$, is $15 \div 12=1.25 \%$.) |  |
| B | The initial balance of loan or savings account. |
| P | The periodic payment. |
| F | The future value of a savings account or balance of a loan. |

## Example:

Part 1. You are financing the purchase of a car with a 3 -year (36-month) loan at $10.5 \%$ annual interest compounded monthly. The purchase price of the car is $\$ 7,250$. Your down payment is $\$ 1,500$.

## Keys: <br> (In RPN mode)

DISPLAY $\{\mathrm{FIX}\}$

value
B?
value
B?
5.750 .00

SOLVING
$\mathrm{F}=$
$-186.89$

Selects FIX 2 display format. $\mathrm{F} \times 10 \mathrm{0} \times(1-\mathrm{C} 1+\mathrm{I} \div$ Displays the leftmost part of the TVM equation.
Selects P; prompts for $I$.

Converts your annual interest rate input to the equivalent monthly rate.
Stores 0.88 in I; prompts for $N$.
Stores 36 in $N$; prompts for $F$.

Stores 0 in $F ;$ prompts for $B$.

Calculates $B$, the beginning loan balance.
Stores 5750 in $B$; calculates monthly payment, $P$.

The answer is negative since the loan has been viewed from the borrower's perspective. Money received by the borrower (the beginning balance) is positive, while money paid out is negative.

Part 2. What interest rate would reduce the monthly payment by $\$ 10$ ?

## Keys: (In RPN mode)

| R/S | F? | Retains 36 in $N$; prompts for $F$. |
|  | 6. 20 |  |
| R/S | B? | Retains 0 in $F$; prompts for $B$. |
|  | 5.750.00 |  |
| R/S | SOLVING | Retains 5750 in $B$; calculates monthly interest rate. |
|  | $\mathrm{I}=$ |  |
|  | 0.56 |  |
| $12 \times$ | 6.75 | Calculates annual interest rate. |

Part 3. Using the calculated interest rate (6.75\%), assume that you sell the car after 2 years. What balance will you still owe? In other words, what is the future balance in 2 years?

Note that the interest rate, l, from part 2 is not zero, so you won't get a DIVIDE $\mathrm{BY} \mathrm{B}_{\mathrm{a}}$ error when you calculate the new I .

## Keys: <br> (In RPN mode)

$\square$ EQN
$\mathrm{F} \times 100 \times(1-<1+\mathrm{I} \div$ Displays leftmost part of the TVM equation.
SOLVE F
F?
$-176.89$

## Prime Number Generator

This program accepts any positive integer greater than 3 . If the number is a prime number (not evenly divisible by integers other than itself and 1 ), then the program returns the input value. If the input is not a prime number, then the program returns the first prime number larger than the input.

The program identifies non-prime numbers by exhaustively trying all possible factors. If a number is not prime, the program adds 2 (assuring that the value is still odd) and tests to see if it has found a prime. This process continues until a prime number is found.

## Program Listing：

## Program Lines： <br> （In ALG mode）

## Description

$Y 0001$ LEL $Y$ This routine displays prime number $P$ ．
Y0062 VIENF
Checksum and length：AA7A 6

Z0001 LBL $Z \quad$ This routine adds 2 to $P$ ．
20002 2
Z0603 RCL＋ F
Checksum and length： 869621
P0001 LEL $P \quad$ This routine stores the input value for $P$ ．
P60日2 ST0 F
P0003 $\div$
P0004 2
PG065 ENTER
P0066 FF
P60日 $x<>y$
P6008 6
P0009 x＝y？Tests for even input．
P60161
P0011 ST0＋$F$ Increments $P$ if input an even number．
P00123 Stores 3 in test divisor，$D$ ．
P日613 STO
Checksum and length：DOB8 87

| X0001 LEL $X$ | This routine tests $P$ to see if it is prime． |
| :---: | :---: |
| K0002 RCL $F$ |  |
| \％ $0003 \mathrm{RCL} \div \mathrm{D}$ |  |
| X0604 FF | Finds the fractional part of $P \div D$ ． |
| X0005 $\times=00$ | Tests for a remainder of zero（not prime）． |
| X0006 0T0 2 | If the number is not prime，tries next possibility． |
| X0007 RCL F |  |
| x0008 $\sqrt{ } \times$ |  |
| x0009 $x<\gg$ |  |

## Program Lines: (In ALG mode)

## Description

XG010 RCL x0011 $x>y ?$ Tests to see whether all possible factors have been tried. X0012 GTOY If all factors have been tried, branches to the display routine.
x00132 Calculates the next possible factor, $D+2$.
X0014 ST0+
X0015 GT0 $X \quad$ Branches to test potential prime with new factor.
Checksum and length: 161E 57

## Flags Used:

None.

## Program Instructions:

1. Key in the program routines; press $C$ when done.
2. Key in a positive integer greater than 3 .
3. Press XEQ $P$ to run program. Prime number, $P$ will be displayed.
4. To see the next prime number, press $R / \mathbf{S}$.

## Variables Used:

P Prime value and potential prime values.
$D \quad$ Divisor used to test the current value of $P$.

## Remarks:

No test is made to ensure that the input is greater than 3.

## Example:

What is the first prime number after 789 ? What is the next prime number?

| Keys: <br> (In ALG mode) | Display: | Description: |
| :--- | :--- | :--- |
| 789 XEQ P | $\mathrm{F}=$ |  |
|  | 797.0000 | Calculates next prime number |
| after 789. |  |  |

Appendixes and Reference

## A

## Support, Batteries, and Service

## Calculator Support

You can obtain answers to questions about using your calculator from our Calculator Support Department. Our experience shows that many customers have similar questions about our products, so we have provided the following section, "Answers to Common Questions." If you don't find an answer to your question, contact the Calculator Support Department listed on page A-7.

## Answers to Common Questions

Q: How can I determine if the calculator is operating properly?
A: Refer to page A-5, which describes the diagnostic self-test.
Q: My numbers contain commas instead of periods as decimal points. How do I restore the periods?

A: Use the MODES $\{\cdot\}$ function (page 1-18).
Q: How do I change the number of decimal places in the display?
A: Use the DISPLAY menu (page 1-19).
Q: How do I clear all or portions of memory?
A: CLEAR displays the CLEAR menu, which allows you to clear all variables, all programs (in program entry only), the statistics registers, or all of user memory (not during program entry).

Q: What does an " E " in a number (for example, $2 \cdot 51 \mathrm{E}-13$ ) mean?
A: Exponent of ten; that is, $2.51 \times 10^{-13}$.
Q: The calculator has displayed the message MEMORY FULL What should I do?

A: You must clear a portion of memory before proceeding. (See appendix B.)
Q: Why does calculating the sine (or tangent) of $\pi$ radians display a very small number instead of 0 ?

A: $\pi$ cannot be represented exactly with the 12-digit precision of the calculator.
Q: Why do I get incorrect answers when I use the trigonometric functions?
A: You must make sure the calculator is using the correct angular mode ( MODES $\{D E G\},\{R A D\}$, or $\{E R A D\}$ ).

Q: What does an annunciator in the display mean?
A: It indicates something about the status of the calculator. See "Annunciators" in chapter 1.

Q: Numbers show up as fractions. How do I get decimal numbers?
A: Press FDISP.

## Environmental Limits

To maintain product reliability, observe the following temperature and humidity limits:

- Operating temperature: 0 to $45^{\circ} \mathrm{C}\left(32\right.$ to $\left.113^{\circ} \mathrm{F}\right)$.
- Storage temperature: -20 to $65^{\circ} \mathrm{C}\left(-4\right.$ to $\left.149{ }^{\circ} \mathrm{F}\right)$.
- Operating and storage humidity: $90 \%$ relative humidity at $40^{\circ} \mathrm{C}\left(104{ }^{\circ} \mathrm{F}\right)$ maximum.

## Changing the Batteries

The calculator is powered by two 3 -volt lithium coin batteries, CR2032.
Replace the batteries as soon as possible when the low battery annunciator ( $\square$ ) appears. If the battery annunciator is on, and the display dims, you may lose data. If data is lost, the MEMORY CLEAR message is displayed.

## A-2 Support, Batteries, and Service

Once you've removed the batteries, replace them within 2 minutes to avoid losing stored information. (Have the new batteries readily at hand before you open the battery compartment.)

## To install batteries:

1. Have two fresh button-cell batteries at hand. Avoid touching the battery terminals - handle batteries only by their edges.
2. Make sure the calculator is OFF. Do not press ON ( $\mathbb{C}$ ) again until the entire battery-changing procedure is completed. If the calculator is ON when the batteries are removed, the contents of Continuous Memory will be erased.
3. Turn the calculator over and slide off the battery cover.

4. Never remove two old batteries at the same time, to prevent memory lose. Remove one of the two batteries. Press down the holder. Push the plate in the shown direction and lift it.
 in fire. The batteries can burst or explode, releasing hazardous chemicals.
5. Insert a new CR2032 lithium battery, making sure that the positive sign ( + ) is facing outward. Replace the plate and push it into its original place.
6. Remove and insert the other battery as in step $4 \sim 5$. Make sure that the positive sign (+) on each battery is facing outward.
7. Replace the battery compartment cover.
8. Press $C$.

## Testing Calculator Operation

Use the following guidelines to determine if the calculator is working properly. Test the calculator after every step to see if its operation has been restored. If your calculator requires service, refer to page A-7.

- The calculator won't turn on (steps 1-4) or doesn't respond when you press the keys (steps 1-3):

1. Reset the calculator. Hold down the $C$ key and press $L \mathbb{N}$. It may be necessary to repeat these reset keystrokes several times.
2. Erase memory. Press and hold down [ $\mathbb{C}$, then press and hold down both $e^{x}$ and $\Sigma^{+}$. Memory is cleared and the MEMORY CLEAR message is displayed when you release all three keys.
3. Remove the batteries (see "Changing the Batteries") and lightly press a coin against both battery contacts in the calculator. Replace the batteries and turn on the calculator. It should display MEMORY CLEAR.
4. If the calculator still does not respond to keystrokes, use a thin, pointed object to press the RESET hole. Stored data usually remain intact.

If these steps fail to restore calculator operation, it requires service.

- If the calculator responds to keystrokes but you suspect that it is malfunctioning:

1. Do the self-test described in the next section. If the calculator fails the self test, it requires service.
2. If the calculator passes the self-test, you may have made a mistake operating the calculator. Reread portions of the manual and check "Answers to Common Questions" (page A-1).
3. Contact the Calculator Support Department listed on page A-7.

## The Self-Test

If the display can be turned on, but the calculator does not seem to be operating properly, do the following diagnostic self-test.

1. Hold down the $[$ key, then press $[x]$ at the same time.
2. Press any key eight times and watch the various patterns displayed. After you've pressed the key eight times, the calculator displays the copyright message © $2003 \mathrm{HF} \mathrm{DEV} \mathrm{CO} . \mathrm{L}$. F. and then the message KED 01 .
3. Starting from $e^{x}$ and moving from left to right, press each key in the top row. Then, moving left to right, press each key in the second row, the third row, and so on, until you've pressed $\ddagger$. Then, continue to press these keys in order: ENG $\uparrow$ MODES $\longleftarrow \rightarrow$ SOLVE $\downarrow$ DISPLAY.

- If you press the keys in the proper order and they are functioning properly, the calculator displays KED followed by two-digit numbers. (The calculator is counting the keys using hexadecimal base.)
- If you press a key out of order, or if a key isn't functioning properly, the next keystroke displays a fail message (see step 4).

4. The self-test produces one of these two results:

- The calculator displays $335-\mathrm{KK}$ if it passed the self-test. Go to step 5 .
- The calculator displays 335 -FAIL followed by a one-digit number, if it failed the self-test. If you received the message because you pressed a key out of order, reset the calculator (hold down $C$, press $\lfloor\mathbb{N}$ ) and do the self test again. If you pressed the keys in order, but got this message, repeat the self-test to verify the results. If the calculator fails again, it requires service (see page A-7). Include a copy of the fail message with the calculator when you ship it for service.

5. To exit the self-test, reset the calculator (hold down $[C$ and press $[\mathbb{N}$ ).

Pressing [ $C$ and $1 / x$ starts a continuous self-test that is used at the factory. You can halt this factory test by pressing any key.

## Warranty

HP 33s Scientific Calculator; Warranty period: 12 months

1. HP warrants to you, the end-user customer, that HP hardware, accessories and supplies will be free from defects in materials and workmanship after the date of purchase, for the period specified above. If HP receives notice of such defects during the warranty period, HP will, at its option, either repair or replace products which prove to be defective. Replacement products may be either new or like-new.
2. HP warrants to you that HP software will not fail to execute its programming instructions after the date of purchase, for the period specified above, due to defects in material and workmanship when properly installed and used. If HP receives notice of such defects during the warranty period, HP will replace software media which does not execute its programming instructions due to such defects.
3. HP does not warrant that the operation of HP products will be uninterrupted or error free. If HP is unable, within a reasonable time, to repair or replace any product to a condition as warranted, you will be entitled to a refund of the purchase price upon prompt return of the product.
4. HP products may contain remanufactured parts equivalent to new in performance or may have been subject to incidental use.
5. Warranty does not apply to defects resulting from (a) improper or inadequate maintenance or calibration, (b) software, interfacing, parts or supplies not supplied by HP, (c) unauthorized modification or misuse, (d) operation outside of the published environmental specifications for the product, or (e) improper site preparation or maintenance.
6. HP MAKES NO OTHER EXPRESS WARRANTY OR CONDITION WHETHER WRITTEN OR ORAL. TO THE EXTENT ALLOWED BY LOCAL LAW, ANY IMPLIED WARRANTY OR CONDITION OF MERCHANTABILITY, SATISFACTORY QUALITY, OR FITNESS FOR A PARTICULAR PURPOSE IS LIMITED TO THE DURATION OF THE EXPRESS WARRANTY SET FORTH ABOVE. Some countries, states or provinces do not allow limitations on the duration of an implied warranty, so the above limitation or exclusion might not apply to you. This warranty gives you specific legal rights and you might also have other rights that vary from country to country, state to state, or province to province.
7. TO THE EXTENT ALLOWED BY LOCAL LAW, THE REMEDIES IN THIS WARRANTY STATEMENT ARE YOUR SOLE AND EXCLUSIVE REMEDIES. EXCEPT AS INDICATED ABOVE, IN NO EVENT WILL HP OR ITS SUPPLIERS BE LIABLE FOR LOSS OF DATA OR FOR DIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL (INCLUDING LOST PROFIT OR DATA), OR OTHER DAMAGE, WHETHER BASED IN CONTRACT, TORT, OR OTHERWISE. Some countries, States or provinces do not allow the exclusion or limitation of incidental or consequential damages, so the above limitation or exclusion may not apply to you.
8. The only warranties for HP products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. HP shall not be liable for technical and editorial errors or omissions contained herein.

FOR CONSUMER TRANSACTIONS IN AUSTRALIA AND NEW ZEALAND: THE WARRANTY TERMS CONTAINED IN THIS STATEMENT, EXCEPT TO THE EXTENT LAWFULLY PERMITTED, DO NOT EXCLUDE, RESTRICT OR MODIFY AND ARE IN ADDITION TO THE MANDATORY STATUTORY RIGHTS APPLICABLE TO THE SALE OF THIS PRODUCT TO YOU.

## Regulatory Information

This section contains information that shows how the HP 33s scientific calculator complies with regulations in certain regions. Any modifications to the calculator not expressly approved by Hewlett-Packard could void the authority to operate the 33 s in these regions.

## USA

This calculator generates, uses, and can radiate radio frequency energy and may interfere with radio and television reception. The calculator complies with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation.
However, there is no guarantee that interference will not occur in a particular installation. In the unlikely event that there is interference to radio or television reception(which can be determined by turning the calculator off and on), the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Relocate the calculator, with respect to the receiver.

## Canada

This Class B digital apparatus complies with Canadian ICES-003.
Cet appareil numerique de la classe B est conforme a la norme NMB-003 du Canada.

## Japan

この装置は，情報処理装置等電波障害自主規制協議会（VCCI）の基準 に基づく第二情報技術装置です。この装置は，家庭環境で使用することを目的 としていますが，この装置がラジオやテレビジョン受信機に近接して使用され ると，受信障害を引き起こすことがあります。

取扱説明書に従って正しい取り扱いをしてください。

Noise Declaration．In the operator position under normal operation（per ISO 7779）：LpA＜70dB．

## User Memory and the Stack

This appendix covers

- The allocation and requirements of user memory,
- How to reset the calculator without affecting memory,
- How to clear (purge) all of user memory and reset the system defaults, and
- Which operations affect stack lift.

## Managing Calculator Memory

The HP 33s has 31 KB of user memory available to you for any combination of stored data (variables, equations, or program lines). SOLVE, / FN, and statistical calculations also require user memory. (The $\int \mathrm{FN}$ operation is particularly "expensive" to run.)

All of your stored data is preserved until you explicitly clear it. The message MEMORY FULL means that there is currently not enough memory available for the operation you just attempted. You need to clear some (or all) of user memory. For instance, you can:

- Clear any or all equations (see "Editing and Clearing Equations" in chapter 6).
- Clear any or all programs (see "Clearing One or More Programs" in chapter 12).
- Clear all of user memory (press © CLEAR \{PLL\}).

To see how much memory is available, press $\boxed{\square}$ MEM. The display shows the number of bytes available.

To see the memory requirements of specific equations in the equation list:

1. Press $\rightarrow$ EQN to activate Equation mode. (EQHLIST TOF or the left end of the current equation will be displayed.)
2. If necessary, scroll through the equation list (press $\uparrow$ or $\downarrow \downarrow$ ) until you see the desired equation.
3. Press SHOW to see the checksum (hexadecimal) and length (in bytes) of the equation. For example, $\mathrm{CK}=382 \mathrm{E} \quad \mathrm{LH}=41$.

To see the total memory requirements of specific programs:

1. Press $⿴ 囗 \rightarrow$ MEM $\{\mathrm{FCM}\}$ to display the first label in the program list.
2. Scroll through the program list (press $\uparrow$ or $\downarrow$ until you see the desired program label and size). For example, LEL F LH=57.
3. Optional: Press SHOW to see the checksum (hexadecimal) and length (in bytes) of the program. For example, $\mathrm{CK}=9 \mathrm{CO} \quad \mathrm{LN}=57$ for program F .

To see the memory requirements of an equation in a program:

1. Display the program line containing the equation.
2. Press SHOW to see the checksum and length. For example, $\mathrm{CK}=\mathrm{FB} 71 \mathrm{~L} \mathrm{~L}=15$.

To manually deallocate the memory allocated for a SOLVE or $\int \mathrm{FN}$ calculation that has been interrupted, press RTN. This deallocation is done automatically whenever you execute a program or another SOLVE or $\int \mathrm{FN}$ calculation.

## Resetting the Calculator

If the calculator doesn't respond to keystrokes or if it is otherwise behaving unusually, attempt to reset it. Resetting the calculator halts the current calculation and cancels program entry, digit entry, a running program, a SOLVE calculation, an $\int$ FN calculation, a VIEW display, or an INPUT display. Stored data usually remain intact.

To reset the calculator, hold down the $[\mathbb{C}$ key and press $\lfloor\mathbb{N}$. If you are unable to reset the calculator, try installing fresh batteries. If the calculator cannot be reset, or if it still fails to operate properly, you should attempt to clear memory using the special procedure described in the next section.

If the calculator still does not respond to keystrokes, use a thin, pointed object to press the RESET hole.
The calculator can reset itself if it is dropped or if power is interrupted.

## B-2 User Memory and the Stack

## Clearing Memory

The usual way to clear user memory is to press CLEAR \{PLL\}. However, there is also a more powerful clearing procedure that resets additional information and is useful if the keyboard is not functioning properly.

If the calculator fails to respond to keystrokes, and you are unable to restore operation by resetting it or changing the batteries, try the following MEMORY CLEAR procedure. These keystrokes clear all of memory, reset the calculator, and restore all format and modes to their original, default settings (shown below):

1. Press and hold down the $C$ key.
2. Press and hold down $e^{x}$.
3. Press $\Sigma+$. (You will be pressing three keys simultaneously). When you release all three keys, the display shows MEMORY CLEFR if the operation is successful.

| Category | CLEAR ALL | MEMORY CLEAR <br> (Default) |
| :--- | :--- | :--- |
| Angular mode | Unchanged | Degrees |
| Base mode | Unchanged | Decimal |
| Contrast setting | Unchanged | Medium |
| Decimal point | Unchanged | " |
| Denominator (/c value) | Unchanged | 4095 |
| Display format | Unchanged | FIX 4 |
| Flags | Unchanged | Cleared |
| Fraction-display mode | Unchanged | Off |
| Random-number seed | Unchanged | Zero |
| Equation pointer | EQN LIST TOP | EQN LIST TOP |
| Equation list | Cleared | Cleared |
| FN = label | Null | Null |
| Program pointer | PRGM TOP | PRGM TOP |
| Program memory | Cleared | Cleared |
| Stack lift | Enabled | Enabled |
| Stack registers | Cleared to zero | Cleared to zero |
| Variables | Cleared to zero | Cleared to zero |

Memory may inadvertently be cleared if the calculator is dropped or if power is interrupted.

## The Status of Stack Lift

The four stack registers are always present, and the stack always has a stack-lift status. That is to say, the stack lift is always enabled or disabled regarding its behavior when the next number is placed in the X-register. (Refer to chapter 2, "The Automatic Memory Stack.")

All functions except those in the following two lists will enable stack lift.

## Disabling Operations

The four operations ENTER, $\Sigma+, \Sigma-$, and CLx disable stack lift. A number keyed in after one of these disabling operations writes over the number currently in the $X$-register. The $Y$-, $Z$ - and T-registers remain unchanged.

In addition, when $[$ and $\leftarrow$ act like $C L x$, they also disable stack lift.
The INPUT function disables stack lift as it halts a program for prompting (so any number you then enter writes over the X-register), but it enables stack lift when the program resumes.

## Neutral Operations

The following operations do not affect the status of stack lift:

| DEG, RAD, | FIX, SCI, | DEC, HEX, | CLVARS |
| :---: | :---: | :---: | :---: |
| GRAD | ENG, ALL | OCT, BIN |  |
| PSE | SHOW | RADIX . RADIX, | CLI |
| OFF | R/S and STOP | $\uparrow$ and $\downarrow$ | C * and $\square$ * |
| MEM \{VAR $\}^{* *}$ | MEM $\{\mathrm{PCH}\}^{* *}$ | GTO $\bullet \bullet$ | GTO - label nnnn |
| EQN | FDISP | Errors | PRGM and program entry |
| Switching binary windows | Digit entry |  |  |
| * Except when us <br> ** Including all <br> \{URR\} ENTER] and | sed like CLx. <br> operations perfo <br> nd $\{\mathrm{PCM}\}$ XEQ, | med while the ca wich enable stack | alog is displayed exc ift. |

## The Status of the LAST X Register

The following operations save $x$ in the LAST $X$ register:

| $+,-, \times, \div$ | $\sqrt{x}, \mathrm{x}^{2}, \sqrt[3]{x}, \mathrm{x}^{3}$ | $e^{x}, 10^{x}$ |
| :---: | :---: | :---: |
| LN, LOG | $y^{x}, \sqrt[x]{y}$ | I/x, INT $\div$, Rmdr |
| $\hat{x}, \hat{y}$ | SIN, COS, TAN | ASIN, ACOS, ATAN |
| SINH, COSH, TANH | ASINH, ACOSH, ATANH | IP, FP, SGN, INTG, RND, ABS |
| \%, \%CHG | $\Sigma+, \Sigma-$ | RCL+,,$- \times$ - |
| $y, x \rightarrow \theta, r$ | $\rightarrow \mathrm{HR}, \rightarrow \mathrm{HMS}$ | $\rightarrow$ DEG, $\rightarrow$ RAD |
| $\theta, r \rightarrow y, x$ |  |  |
| nCr | $x!$ | CMPLX +/- |
| $n \mathrm{Pr}$ |  |  |
| CMPLX,,$+- \times, \div$ | $\begin{aligned} & \text { CMPLX ex, LN, } y^{x}, \\ & 1 / x \end{aligned}$ | CMPLX SIN, COS, TAN |
| $\begin{aligned} & \rightarrow \mathrm{kg}, \rightarrow \mathrm{lb} \\ & \rightarrow \mathrm{l}, \rightarrow \mathrm{gal} \end{aligned}$ | $\rightarrow{ }^{\circ} \mathrm{C}, \rightarrow^{\circ} \mathrm{F}$ | $\rightarrow \mathrm{cm}, \rightarrow$ in |

Notice that / c does not affect the LAST X register.
The recall-arithmetic sequence $x$ RCL $\pm$ variable stores a different value in the LAST $X$ register than the sequence $x$ RCL variable + does. The former stores $x$ in LAST $X$; the latter stores the recalled number in LAST $X$.

## ALG: Summary

## About ALG

This appendix summarizes some features unique to ALG mode, including,

- Two-number arithmetic
- Chain calculation
- Reviewing the stack
- Coordinate conversions
- Operations with complex numbers
- Integrating an equation
- Arithmetic in bases 2, 8, and 16
- Entering statistical two-variable data

Press $\rightarrow$ ALG to set the calculator to ALG mode. When the calculator is in ALG mode, the ALG annunciator is on.

In ALG mode, operations are performed in the following order.

1. Expression in parenthesis.
2. Function that require inputting values before pressing the function key, for example, COS, SIN, TAN, ACOS, ASIN, ATAN, LOG, LN, $x^{2}, 1 / x, \sqrt{x}, \pi$, $\sqrt[3]{x}, X!, \%, C M P L X, R N D, R A N D, I P, F P, I N T G, S G N, A B S, e^{x}, 10^{x}$, unit conversion.
3. $\sqrt[x]{y}$ and $y^{x}$.
4. $n P r, n C r, \% C H G$.
5. $\times, \div$, $N T \div$ Rmdr.
6.,+- .

## Doing Two-number Arithmetic in ALG

This discussion of arithmetic using ALG replaces the following parts that are affected by ALG mode. One-number functions (such as $\sqrt{x}$ ) work the same in ALG and RPN modes.

Two-number arithmetic operations are affected by ALG mode:

- Simple arithmetic
- Power functions ( $\sqrt[y^{x}]{\underline{x} \sqrt{x}}$ )
- Percentage calculations (\% or $\because$ \% $\%$ )

- Quotient and Remainder of Division ( $\boxed{\square}$ (NT $\div$, $\rightarrow$ Rmdr)

## Simple Arithmetic

Here are some examples of simple arithmetic.
In ALG mode, you enter the first number, press the operator ( $\pm, \square, x, \square)$, enter the second number, and finally press the ENTER key.

| To Calculate: | Press: | Display: |
| :---: | :---: | :---: |
| $12+3$ | $12 \pm 3$ ENTER | $12+3=$ |
|  |  | 15.6060 |
| 12-3 | 12 - ENTER | $12-3=$ |
|  |  | 9.0060 |
| $12 \times 3$ | $12 \times 3$ ENTER | $12 \times 3=$ |
|  |  | 36.6060 |
| $12 \div 3$ | $12 \div 3$ ENTER | $12 \div 3=$ |
|  |  | 4.0006 |

## Power Functions

In ALG mode, to calculate a number $y$ raised to a power $x$, key in $y y^{x} x$, then press ENTER.

| To Calculate: | Press: | Display: |
| :---: | :---: | :---: |
| $12^{3}$ | 12 [x] ENTER | $12 \times 3=$ |
|  |  | 1,728.0000 |
| $64^{1 / 3}$ (cube root) | $3{ }^{\text {x] }} 64$ ENTER | $3 \times \sqrt{64}=$ |

## Percentage Calculations

The Percent Function. The \% key divides a number by 100. Combined with $\square$ or $\square$, it adds or subtracts percentages.

| To Calculate: | Press: | Display: |
| :---: | :---: | :---: |
| $27 \%$ of 200 | 200 区 27 \% ENTER | 200x27\% $=$ |
|  |  | 54.0000 |
| 200 less 27\% | 200 - 27 \% ENTER | 200-27\%= |
|  |  | 146.0006 |
| 12\% greater than 25 | 25 + 12 \% ENTER | 25+12\% $=$ |
|  |  | 28.0000 |

| To Calculate: | Press: |
| :---: | :---: |
| $x \%$ of $y$ <br> Percentage change from $y$ to $x .(y \neq 0)$ | $\begin{aligned} & y \pm \times \text { \% ENTER } \\ & y \text { \#CHG } \times \text { ENTER } \end{aligned}$ |

Compare these keystrokes in RPN and ALG modes:

|  | RPN Mode | ALG Mode |
| :---: | :---: | :---: |
| $27 \%$ of 200 | 200 ENTER 27 \% | $\begin{aligned} & 200 \times 27 \text { 区 } \\ & \text { ENTER] } \end{aligned}$ |
| 200 less 27\% | 200 ENTER 27 \% $\square^{\circ}$ | $\begin{aligned} & 200 \square 27 \text { \% } \\ & \text { ENTER] } \end{aligned}$ |

## Example：

Suppose that the $\$ 15.76$ item cost $\$ 16.12$ last year．What is the percentage change from last year＇s price to this year＇s？
Keys：
Display：

## Description：

16.12 \％ B CH
15.76 ENTER

16．12\％CHG15．76＝ －2．2333

This year＇s price dropped about $2.2 \%$ from last year＇s price．

## Permutations and Combinations

## Example：Combinations of People．

A company employing 14 women and 10 men is forming a six－person safety committee．How many different combinations of people are possible？
Keys：
Display：
Description：

24 nCr 6 ENTER
24nCr6＝
Total number of combinations 134，596．0000 possible．

## Quotient and Remainder Of Division

You can use $⿴ 囗 x$ RT $\div$ and Rmdr to produce either the quotient or remainder of division operations involving two integers．

Integer 1 国 $\boldsymbol{N} \boldsymbol{-}$ Integer 2.
Integer $1 \rightarrow$ Rmdr Integer 2.

## Example：

To display the quotient and remainder produced by $58 \div 9$
Keys：Display：Description：
58 国 1 NT $\div 9$ ENTER
$58 \mathrm{I} \because \mathrm{T} \div 9=$ Displays the quotient．
6． 0060
58 Rmdr 9 ENTER 58RMDR9＝Displays the remainder． 4．0000

## Parentheses Calculations

In ALG mode, you can use parentheses up to 13 levels. For example, suppose you want to calculate:

$$
\frac{30}{85-12} \times 9
$$

If you were to key in $30 \div 85 \square$, the calculator would calculate the intermediate result, 0.35 . However, that's not what you want. To delay the division until you've subtracted 12 from 85, use parentheses:

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| $30 \div \square$ | 36\% 685 | No calculation is |
|  | 85.6040 | done. |
| $12 \rightarrow \square$ | $30 \div(85-12)$ | Calculates $85-12$. |
|  | 73.0006 |  |
| x 9 | $30 \div(85-12) \times$ | Calculates 30/73. |
|  | 9 |  |
| ENTER | $30 \div(85-12) \times 9=$ | Calculates 30/(85- |
|  | 3.6986 | 12) $\times 9$. |

You can omit the multiplication sign $(x)$ before a left parenthesis. Implied multiplication is not available in Equation mode. For example, the expression $2 \times$
 inserted between 2 and the left parenthesis.

## Chain Calculations

To do a chain calculation, you don't need to press ENTER after each operation, but only at the very end.

For instance, to calculate $\frac{750 \times 12}{360}$ you can enter either:

```
750 ख 12 ENTER `` 360 ENTER
```

or
750 区 12 † 360 ENTER
In the second case，the $\ddagger$ key acts like the ENTER key by displaying the result of $750 \times 12$ ．

Here＇s a longer chain calculation：$\frac{456-75}{18.5} \times \frac{68}{1.9}$
This calculation can be written as： $456 \square 75$ ENTER $\dagger 18.5$ 区 $68 \div 1.9$ ENTER．Watch what happens in the display as you key it in：

## Keys：

$456-75$ ENTER
$\div 18.5$ 区
$68 \div$
1.9 ENTER

## Display：

456－75＝
381.0000

381：18．5x
20.5946
$381 \div 18.5 \times 68 \div$
1，406．4324
$381 \div 18.5 \times 68 \div 1.9=$
737.6697

## Reviewing the Stack

The $R+\mathrm{Rt}$ or key produces a menu in the display－ $\mathrm{X1}-\mathrm{C}, \mathrm{X} 2-\mathrm{X} 3-$ ， X4－registers，to let you review the entire contents of the stack．The difference between the $R+$ and the $\square R$ key is the location of the underline in the display．Pressing the $⿴ 囗 \mathbb{R}$ displays the underline on the X 4 register；pressing the $\mathbb{R} \downarrow$ displays the underline on the X 2 register．

Pressing $\mathbb{R} \downarrow$ displays the following menu：
X1 X2 $83 \times 4$
value
Pressing RT displays the following menu：
$81 \times 2 \times 384$
value

## C－6 ALG：Summary

You can press $\rightarrow$ or $\leftleftarrows$ (or $\mathbb{R}$ and $\square \mathbb{R}$ ) to review the entire contents of the stack and recall them.

However, in normal operation in ALG mode, the stack in ALG mode differs from the one in RPN mode. (Because when you press ENTER, the result is not placed into X1, X2 etc.) Only after evaluating equations, programs, or integrating equations, the values of the four registers will be the same as in RPN mode.

## Coordinate Conversions

## To convert between rectangular and polar coordinates:

1. Enter the coordinates (in rectangular or polar form) that you want to convert. In ALG mode, the order is $y[x \not y]$ or $\theta[x \not y]$ r.
2. Execute the conversion you want: press $\boxed{\rightarrow \theta} \boldsymbol{\square} \boldsymbol{r}$ (rectangular-to-polar) or $\rightarrow \rightarrow y, x$ (polar-to-rectangular). The converted coordinates occupy the $X$ and $Y$-registers.
3. The resulting display (the X -register) shows either $r$ (polar result) or $x$ (rectangular result). Press $\downarrow$ to see $\theta$ or $y$.

## Example:

If $x=5, y=30$, what are $r, \theta$ ?
Keys: Display: Description:
MODES \{DEG\}
Sets Degrees mode.

$\downarrow$
$30,5 \rightarrow \theta, r \quad$ Calculates hypotenuse ( $r$ ).
$r=30.4138$
$30,5 \rightarrow \theta$ Displays $\theta$.
$\theta=80.5377$
If $r=25, \theta=56$, what are $\mathrm{x}, \mathrm{y}$ ?
Keys:
Display:

## Description:

MODES \{DEG\}
Sets Degrees mode.

$\mathrm{X}=13.9798$

$$
\begin{aligned}
& 56.25 \rightarrow Y: x \quad \text { Displays } y . \\
& Y=20.7259
\end{aligned}
$$

If you want to perform a coordinate conversion as part of a chain calculation, you need to use parentheses to impose the required order of operations.

## Example:

If $r=4.5, \theta=\frac{2}{3} \pi$, what are $\mathrm{x}, \mathrm{y}$ ?
Keys:
Display:
Description:
$(2 \div 3 \times \pi)$
2.0944
$x \rightarrow y$ 4.5 $\rightarrow y, x$ $2.09439510239,4$, Calculates X=-2. 2500 $2.09439510239,4, \quad$ Displays $y$. $\mathrm{Y}=3.8971$

MODES \{RAD\}
(T) 2 — 3 区
$\rightarrow \pi$
$\downarrow$

## Integrating an Equation

1. Key in an equation. (see "Entering Equations into the Equation List" in chapter 6) and leave Equation mode.
2. Enter the limits of integration: key in the lower limit and press $x \not x y$, then key in the upper limit.
3. Display the equation: Press EQN and, if necessary, scroll through the equation list (press $\uparrow$ or $\downarrow$ ) to display the desired equation.
4. Select the variable of integration: Press $\rightarrow$ variable. This starts the calculation.

## Operations with Complex Numbers

To enter a complex number :

$$
x+i y .
$$

1. Type the real part, $x$, then the function key.
2. Type the imaginary part, $y$, then press CMPLX.

Fox example, to do $2+i 4$, press $2 \square 4$ CMPLX.

## To view the result of complex operations :

After keying in the complex number, press ENTER to calculate. Then the real portion of the result is displayed; press $\downarrow$ to view the imaginary portion.

## Complex Operations

Use the complex operations as you do real operations, but follow the imaginary part with © CMPLX.

## To do an operation with one complex number:

1. Enter the complex number $z$. (Use parentheses for $z$ if the real part exists).
2. Select the complex function.
3. Press ENTER to calculate.

## To do an arithmetic operation with two complex numbers:

1. Enter the first complex number, $z_{1}$. (Use parentheses for $z$ if the real part exists).
2. Select the arithmetic operation.
3. Enter the second complex number, $z_{2}$. (Use parentheses for $z$ if the real part exists).
4. Press ENTER to calculate.

Here are some examples with complex numbers:

## Examples:

Evaluate $\sin (2+3 i)$
Keys:
Display:
Description:
(T) 2 + 2 -

CMPLX $\rightarrow \square$

| (2+3i) |  |
| :---: | :---: |
| $\mathrm{RE}=2 \cdot 0000$ |  |
| SIN(2+3i) |  |
| $\mathrm{RE}=9.1545$ |  |
| SIN(2+3i) | Result is $9.1545-i 4.1689$ |
| $\mathrm{IM}=-4.1689$ |  |

## Examples:

Evaluate the expression

$$
\text { z } 1 \div\left(z_{2}+z_{3}\right),
$$

where $\mathrm{z}_{1}=23+i 13, \mathrm{z}_{2}=-2+i \quad \mathrm{z}_{3}=4-i 3$

Keys:
(1) $23+13$
$\rightarrow$ CMPLX $\rightarrow 1$
$\div \square \square+\square$
1 ( - CMPLX 4

- 3 CT CMPLX
$\rightarrow 1$ ENTER $(23+13 \mathrm{i}) \div(-2+1$
$\mathrm{RE}=2.5000$
$\downarrow$
Display:

Description:
Real part of result.

$$
\begin{array}{ll}
(23+13 i) \div(-2+1 & \text { Result is } \\
I M=9.0000 & 2.5000+i 9.0000
\end{array}
$$

## Examples:

Evaluate (4-i 2/5)(3-i 2/3)

## Keys:

Ⓣ (T) $4 \rightarrow \square 2 \square$ 5 CTB CMPL $\rightarrow \square 3 \square 2$ 3 CMPLX $\rightarrow 1$ ENTER (4-62)5i) $\times(3-$ $\mathrm{RE}=11.7333$
$\downarrow$

## Display:

$$
\begin{array}{ll}
(4-02<5 i) \times(3- & \text { Result is } \\
I M=-3.8667 & 11.7333-i 3.8667
\end{array}
$$

## Description:

Real part of result.

## Arithmetic in Bases 2, 8, and 16

In ALG mode, if the current expression in the first line does not fit in the display, the rightmost digits are replaced with an ellipsis ( $\cdot \mathrm{C} \cdot$ ) to indicate it is too long to be displayed.

Here are some examples of arithmetic in Hexadecimal, Octal, and Binary modes:

## Example:

$$
12 \mathrm{~F}_{16}+\mathrm{EqA}_{16}=?
$$

Keys:

## Description:

(6] BASE $\{\mathrm{HE} \%\}$
$12 \mathrm{~F} \pm$ E9A ENTER
$h_{1} 2 \mathrm{~F}+\mathrm{hE} 9 \mathrm{~F}=$
Sets base 16; HEX annunciator on. Result.
FCg

$$
77608-43268=?
$$

( BASE $\{0 \mathrm{CT}\}$
$\mathrm{h} 12 \mathrm{~F}+\mathrm{hE} 9 \mathrm{~F}=$ 7711
7760 - 4326 ENTER
07760-04326= 3432

Sets base 8: OCT annunciator on. Converts displayed number to octal.

## Entering Statistical Two-Variable Data

In ALG mode, remember to enter an ( $x, y$ ) pair in reverse order $(y x \in y x)$ so that $y$ ends up in the $Y$-register and $X$ in the $X$-register.

1. Press CLEAR $\{\Sigma\}$ to clear existing statistical data.
2. Key in the $y$-value first and press $x \not x$.
3. Key in the corresponding $x$-value and press $\Sigma+$.
4. The display shows $n$, the number of statistical data pairs you have accumulated.
5. Continue entering $x, y$-pairs. $n$ is updated with each entry.

## Example:

Key in the $x, y$-values on the left, these make the corrections shown on the right:

| Initial $\mathbf{x}, \mathbf{y}$ | Corrected $\mathbf{x}, \mathbf{y}$ |
| :---: | :---: |
| 20,4 | 20,5 |
| 400,6 | 40,6 |

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| [4] CLEAR $\{\bar{s}\}$ |  | Clears existing statistical data. |
| $4 \times$ x $20 \times$ - | 20.4 | Enters the first new data pair. |
|  | $\mathrm{n}=1.00000$ |  |
| $6 \times$ x $600 \times 5$ | 400.6 | Display shows $n$, the number of data pairs you entered. |
|  | $\mathrm{n}=2.60000$ |  |
| (6) LAST $x$ | LFSTx | Brings back last $x$-value. Last $y$ is still in Y-register. |
|  | 400.0000 |  |
| [6] 5 - | 400.6 | Deletes the last data pair. |
|  | $\pi=1.6006$ |  |
| $6 \times$ x $6 \times y$ | 40.6 | Reenters the last data pair. |
|  | $\mathrm{n}=2.6006$ |  |
| $4 \times 20$ x- 5 - | 20.4 | Deletes the first data pair. |
|  | $\mathrm{n}=1.6000$ |  |
| $5 \times 20 \times$ | 20.5 | Reenters the first data pair. There is still a total of two data pairs in the statistics registers. |
|  | $n=2.6006$ |  |
|  |  |  |

## D

## More about Solving

This appendix provides information about the SOLVE operation beyond that given in chapter 7.

## How SOLVE Finds a Root

SOLVE first attempts to solve the equation directly for the unknown variable. If the attempt fails, SOLVE changes to an iterative(repetitive) procedure. The iterative operation is to execute repetitively the specified equation. The value returned by the equation is a function $f(x)$ of the unknown variable $x$. $(f(x)$ is mathematical shorthand for a function defined in terms of the unknown variable $x$.) SOLVE starts with an estimate for the unknown variable, $x$, and refines that estimate with each successive execution of the function, $f(x)$.

If any two successive estimates of the function $f(x)$ have opposite signs, then SOLVE presumes that the function $f(x)$ crosses the $x$-axis in at least one place between the two estimates. This interval is systematically narrowed until a root is found.

For SOLVE to find a root, the root has to exist within the range of numbers of the calculator, and the function must be mathematically defined where the iterative search occurs. SOLVE always finds a root, provided one exists (within the overflow bounds), if one or more of these conditions are met:

- Two estimates yield $f(x)$ values with opposite signs, and the function's graph crosses the $x$-axis in at least one place between those estimates (figure $a$, below).
- $f(x)$ always increases or always decreases as $x$ increases (figure b, below).
- The graph of $f(x)$ is either concave everywhere or convex everywhere (figure $c$, below).
- If $f(x)$ has one or more local minima or minima, each occurs singly between adjacent roots of $f(x)$ (figure $d$, below).

## Function Whose Roots Can Be Found

In most situations, the calculated root is an accurate estimate of the theoretical, infinitely precise root of the equation. An "ideal" solution is one for which $f(x)=0$. However, a very small non-zero value for $f(x)$ is often acceptable because it might result from approximating numbers with limited (12-digit) precision.

## Interpreting Results

The SOLVE operation will produce a solution under either of the following conditions:

- If it finds an estimate for which $f(x)$ equals zero. (See figure a, below.)
- If it finds an estimate where $f(x)$ is not equal to zero, but the calculated root is a 12-digit number adjacent to the place where the function's graph crosses the $x$-axis (see figure $b$, below). This occurs when the two final estimates are neighbors (that is, they differ by 1 in the 12 th digit), and the function's value is positive for one estimate and negative for the other. Or they are ( 0 , $10^{-499}$ ) or ( $0,-10^{-499}$ ). In most cases, $f(x)$ will be relatively close to zero.
f(x)

$$
f(x)
$$

b

## Cases Where a Root Is Found

To obtain additional information about the result, press $R \downarrow$ see the previous estimate of the root $(x)$, which was left in the $Y$-register. Press $R+$ again to see the value of $f(x)$, which was left in the Z-register. If $f(x)$ equals zero or is relatively small, it is very likely that a solution has been found. However, if $f(x)$ is relatively large, you must use caution in interpreting the results.

## Example: An Equation With One Root.

Find the root of the equation:

$$
-2 x^{3}+4 x^{2}-6 x+8=0
$$

Enter the equation as an expression:

| Keys: | Display: |
| :--- | :--- |
| Description: |  |
| Select Equation mode. |  |

## Example: An Equation with Two Roots.

Find the two roots of the parabolic equation:

$$
x^{2}+x-6=0
$$

Enter the equation as an expression:
Keys:
Display:

## Description:

$\rightarrow$ EQN

## RCL $\times y^{x} 2+$

RCL $\times \square 6$ ENTER $X \times 2+8-6$

Select Equation mode.
Enters the equation.

Checksum and length.

Cancels Equation mode.

## Description:

Initial guesses for the root.
Selects Equation mode; displays the left end of the equation.
Solves for $X$; displays the result.

Final two estimates are the same to four decimal places.
$f(x)$ is very small, so the approximation is a good root.

Selects Equation mode.
Enters the equation.

## D-4 More about Solving

| $\rightarrow$ SHOW | $\mathrm{CK}=3971$ <br> $\mathrm{LH}=7$ | Checksum and length. |
| :--- | :--- | :--- |
| C |  | Cancels Equation mode. |

Now, solve the equation to find its positive and negative roots:

| Keys: | Display: | Description: |
| :---: | :---: | :---: |
| 0 STO $\times 10$ | 10. | Your initial guesses for the positive root. |
| E EQN | $x \wedge 2+x-6$ | Selects Equation mode; displays the equation. |
| SOLVE $X$ | SOLVING | Calculates the positive root using guesses 0 and 10 . |
|  | $\mathrm{x}=$ |  |
|  | 2.0000 |  |
| Rt] | 2.0000 | Final two estimates are the same. |
| R+ $\square^{(1)}$ SHOW | 0.00000000000 | $f(x)=0$. |
| 0 STO $\times 10$ + | -10_ | Your initial guesses for the negative root. |
| B EQN | $x^{\wedge} 2+8-6$ | Redisplays the equation. |
| SOLVE $X$ | SOLVIHE | Calculates negative root using |
|  | $\mathrm{x}=$ | guesses 0 and -10. |
|  | -3.0000 |  |
|  | 0.00000000000 | $f(x)=0$. |

Certain cases require special consideration:

- If the function's graph has a discontinuity that crosses the $x$-axis, then the SOLVE operation returns a value adjacent to the discontinuity (see figure a, below). In this case, $f(x)$ may be relatively large.
- Values of $f(x)$ may be approaching infinity at the location where the graph changes sign (see figure $b$, below). This situation is called a pole. Since the SOLVE operation determines that there is a sign change between two neighboring values of $x$, it returns the possible root. However, the value for $f(x)$ will be relatively large. If the pole occurs at a value of $x$ that is exactly represented with 12 digits, then that value would cause the calculation to halt with an error message.

## Special Case: A Discontinuity and a Pole

## Example: Discontinuous Function.

Find the root of the equation:

$$
\operatorname{IP}(x)=1.5
$$

Enter the equation:

Keys:
$\rightarrow$ EQN

(1)

ENTER
$\rightarrow$ SHOW

C

Display:
Description:
Selects Equation mode.
Enter the equation.

$$
I P(X)=1.5
$$

$\mathrm{CK}=\mathrm{D} 2 \mathrm{C} 1$
$\mathrm{L} \mathrm{H}=9$

Now, solve to find the root:

Keys:
0 STO X
5
$\rightarrow$ EQN

Display:

## Description:

Your initial guesses for the root.

Selects Equation mode; displays the equation.

| SOLVE $X$ | SOLVIHE | Finds a root with guesses 0 and |
| :---: | :---: | :---: |
|  | X= | 5. |
|  | 2.6060 |  |
| $\rightarrow$ SHOW | 1.99999999999 | Shows root, to 11 decimal places. |
| Rt $\rightarrow$ SHOW | 2.00060060060 | The previous estimate is slightly bigger. |
| Rt | -0. 50.060 | $f(x)$ is relatively large. |

Note the difference between the last two estimates, as well as the relatively large value for $f(x)$. The problem is that there is no value of $x$ for which $f(x)$ equals zero. However, at $x=1.99999999999$, there is a neighboring value of $x$ that yields ant opposite sign for $f(x)$.

## Example:

Find the root of the equation

$$
\frac{x}{x^{2}-6}-1=0
$$

As $x$ approaches $\sqrt{6}, f(x)$ becomes a very large positive or negative number.
Enter the equation as an expression.

Keys:
$\rightarrow$ EQN
RCL $\times \div$
$\rightarrow \square \mathrm{RCL} \times$
诸 2 回 6
(T) $\square_{1}$

ENTER
SH SHOW
$\mathrm{X} \div(\mathrm{x} \times 2-6)-1$

$$
C K=7358 \quad \text { Checksum and length. }
$$

Display:

## Description:

Selects Equation mode.
Enters the equation.

$$
L \mathrm{H}=11
$$

C
Cancels Equation mode.

Now, solve to find the root.
Keys:
Display:
Description:
2.3 STO X

SOLVE $X$
$R t$ Rt
2.7
$x \div(x \wedge 2-6)-1$

HO ROOT FHD
$81,649,658$

Your initial guesses for the root.
Selects Equation mode; displays the equation. No root found for $f(x)$. $f(x)$ is relatively large.

## When SOLVE Cannot Find a Root

Sometimes SOLVE fails to find a root. The following conditions cause the message NO ROOT FHD:

- The search terminates near a local minimum or maximum (see figure $a$, below). If the ending value of $f(x)$ (stored in the Z-register) is relatively close to zero, it is possible that a root has been found; the number stored in the unknown variable might be a 12-digit number very close to a theoretical root.
- The search halts because SOLVE is working on a horizontal asymptote-an area where $f(x)$ is essentially constant for a wide range of $x$ (see figure $b$, below). The ending value of $f(x)$ is the value of the potential asymptote.
- The search is concentrated in a local "flat" region of the function (see figure $c$, below). The ending value of $f(x)$ is the value of the function in this region.

a

b

C

## Case Where No Root Is Found

## Example: A Relative Minimum.

Calculate the root of this parabolic equation:

$$
x^{2}-6 x+13=0
$$

It has a minimum at $x=3$.
Enter the equation as an expression:
Keys:
Display:
Description:
$\rightarrow$ EQN
RCL $\times y^{x} 2$
$\square 6 \times \mathrm{xCL} \times \pm$
13 ENTER
$\rightarrow$ SHOW
$x \times 2-6 \times 8+13$

$$
\begin{array}{ll}
\mathrm{CK}=\mathrm{EC} 74 & \text { Checksum and length. } \\
\mathrm{LH}=10 &
\end{array}
$$

Selects Equation mode.
Enters the equation.

Now, solve to find the root:

| Keys: | Display: | Description: |

## Round-Off Error

The limited (12-digit) precision of the calculator can cause errors due to rounding off, which adversely affect the iterative solutions of SOLVE and integration. For example,

$$
\left[(|x|+1)+10^{15}\right]^{2}-10^{30}=0
$$

has no roots because $f(x)$ is always greater than zero. However, given initial guesses of 1 and 2, SOLVE returns the answer 1.0000 due to round-off error.

Round-off error can also cause SOLVE to fail to find a root. The equation

$$
\left|x^{2}-7\right|=0
$$

has a root at $\sqrt{7}$. However, no 12-digit number exactly equals $\sqrt{7}$, so the calculator can never make the function equal to zero. Furthermore, the function never changes sign SOLVE returns the message HO ROOT FND. However, the final estimate of $x$ (press $\leftrightarrows$ to see it) is the best possible 12-digit approximation of the root when the routine quits.

## Underflow

Underflow occurs when the magnitude of a number is smaller than the calculator can represent, so it substitutes zero. This can affect SOLVE results. For example, consider the equation

$$
\frac{1}{x^{2}}
$$

whose root is infinite in value. Because of underflow, SOLVE returns a very large value as a root. (The calculator cannot represent infinity, anyway.)

## More about Integration

This appendix provides information about integration beyond that given in chapter 8.

## How the Integral Is Evaluated

The algorithm used by the integration operation, $\int F N \in x$, calculates the integral of a function $f(x)$ by computing a weighted average of the function's values at many values of $x$ (known as sample points) within the interval of integration. The accuracy of the result of any such sampling process depends on the number of sample points considered: generally, the more sample points, the greater the accuracy. If $f(x)$ could be evaluated at an infinite number of sample points, the algorithm could - neglecting the limitation imposed by the inaccuracy in the calculated function $f(x)$ - always provide an exact answer.

Evaluating the function at an infinite number of sample points would take forever. However, this is not necessary since the maximum accuracy of the calculated integral is limited by the accuracy of the calculated function values. Using only a finite number of sample points, the algorithm can calculate an integral that is as accurate as is justified considering the inherent uncertainty in $f(x)$.

The integration algorithm at first considers only a few sample points, yielding relatively inaccurate approximations. If these approximations are not yet as accurate as the accuracy of $f(x)$ would permit, the algorithm is iterated (repeated) with a larger number of sample points. These iterations continue, using about twice as many sample points each time, until the resulting approximation is as accurate as is justified considering the inherent uncertainty in $f(x)$.

As explained in chapter 8, the uncertainty of the final approximation is a number derived from the display format, which specifies the uncertainty for the function. At the end of each iteration, the algorithm compares the approximation calculated during that iteration with the approximations calculated during two previous iterations. If the difference between any of these three approximations and the other two is less than the uncertainty tolerable in the final approximation, the calculation ends, leaving the current approximation in the X -register and its uncertainty in the Y -register.

It is extremely unlikely that the errors in each of three successive approximations that is, the differences between the actual integral and the approximations would all be larger than the disparity among the approximations themselves. Consequently, the error in the final approximation will be less than its uncertainty (provided that $f(x)$ does not vary rapidly). Although we can't know the error in the final approximation, the error is extremely unlikely to exceed the displayed uncertainty of the approximation. In other words, the uncertainty estimate in the Y-register is an almost certain "upper bound" on the difference between the approximation and the actual integral.

## Conditions That Could Cause Incorrect Results

Although the integration algorithm in the HP 33s is one of the best available, in certain situations it - like all other algorithms for numerical integration - might give you an incorrect answer. The possibility of this occurring is extremely remote. The algorithm has been designed to give accurate results with almost any smooth function. Only for functions that exhibit extremely erratic behavior is there any substantial risk of obtaining an inaccurate answer. Such functions rarely occur in problems related to actual physical situations; when they do, they usually can be recognized and dealt with in a straightforward manner.

Unfortunately, since all that the algorithm knows about $f(x)$ are its values at the sample points, it cannot distinguish between $f(x)$ and any other function that agrees with $f(x)$ at all the sample points. This situation is depicted below, showing (over a portion of the interval of integration) three functions whose graphs include the many sample points in common.

## E-2 More about Integration

With this number of sample points, the algorithm will calculate the same approximation for the integral of any of the functions shown. The actual integrals of the functions shown with solid blue and black lines are about the same, so the approximation will be fairly accurate if $f(x)$ is one of these functions. However, the actual integral of the function shown with a dashed line is quite different from those of the others, so the current approximation will be rather inaccurate if $f(x)$ is this function.

The algorithm comes to know the general behavior of the function by sampling the function at more and more points. If a fluctuation of the function in one region is not unlike the behavior over the rest of the interval of integration, at some iteration the algorithm will likely detect the fluctuation. When this happens, the number of sample points is increased until successive iterations yield approximations that take into account the presence of the most rapid, but characteristic, fluctuations.

For example, consider the approximation of

$$
\int_{0}^{\infty} x e^{-x} d x
$$

Since you're evaluating this integral numerically, you might think that you should represent the upper limit of integration as 10499 , which is virtually the largest number you can key into the calculator.
Try it and see what happens. Enter the function $f(x)=x e^{-x}$.

## Description:

Specifies accuracy level and limits of integration.
Selects Equation mode; displays the equation.
Approximation of the integral.

The answer returned by the calculator is clearly incorrect, since the actual integral of $f(x)=x e^{-x}$ from zero to $\infty$ is exactly 1 . But the problem is not that $\infty$ was represented by 10499 , since the actual integral of this function from zero to 10499 is very close to 1 . The reason for the incorrect answer becomes apparent from the graph of $f(x)$ over the interval of integration.

The graph is a spike very close to the origin. Because no sample point happened to discover the spike, the algorithm assumed that $f(x)$ was identically equal to zero throughout the interval of integration. Even if you increased the number of sample points by calculating the integral in SCl 11 or ALL format, none of the additional sample points would discover the spike when this particular function is integrated over this particular interval. (For better approaches to problems such as this, see the next topic, "Conditions That Prolong Calculation Time.")

Fortunately, functions exhibiting such aberrations (a fluctuation that is uncharacteristic of the behavior of the function elsewhere) are unusual enough that you are unlikely to have to integrate one unknowingly. A function that could lead to incorrect results can be identified in simple terms by how rapidly it and its low-order derivatives vary across the interval of integration. Basically, the more rapid the variation in the function or its derivatives, and the lower the order of such rapidly varying derivatives, the less quickly will the calculation finish, and the less reliable will be the resulting approximation.

Note that the rapidity of variation in the function (or its low-order derivatives) must be determined with respect to the width of the interval of integration. With a given number of sample points, a function $f(x)$ that has three fluctuations can be better characterized by its samples when these variations are spread out over most of the interval of integration than if they are confined to only a small fraction of the interval. (These two situations are shown in the following two illustrations.) Considering the variations or fluctuation as a type of oscillation in the function, the criterion of interest is the ratio of the period of the oscillations to the width of the interval of integration: the larger this ratio, the more quickly the calculation will finish, and the more reliable will be the resulting approximation.

## E-6 More about Integration

In many cases you will be familiar enough with the function you want to integrate that you will know whether the function has any quick wiggles relative to the interval of integration．If you＇re not familiar with the function，and you suspect that it may cause problems，you can quickly plot a few points by evaluating the function using the equation or program you wrote for that purpose．

If，for any reason，after obtaining an approximation to an integral，you suspect its validity，there＇s a simple procedure to verify it：subdivide the interval of integration into two or more adjacent subintervals，integrate the function over each subinterval， then add the resulting approximations．This causes the function to be sampled at a brand new set of sample points，thereby more likely revealing any previously hidden spikes．If the initial approximation was valid，it will equal the sum of the approximations over the subintervals．

## Conditions That Prolong Calculation Time

In the preceding example，the algorithm gave an incorrect answer because it never detected the spike in the function．This happened because the variation in the function was too quick relative to the width of the interval of integration．If the width of the interval were smaller，you would get the correct answer；but it would take a very long time if the interval were still too wide．

Consider an integral where the interval of integration is wide enough to require excessive calculation time，but not so wide that it would be calculated incorrectly． Note that because $f(x)=x e^{-x}$ approaches zero very quickly as $x$ approaches $\infty$ ， the contribution to the integral of the function at large values of $x$ is negligible． Therefore，you can evaluate the integral by replacing $\infty$ ，the upper limit of integration，by a number not so large as $10^{499}$－say $10^{3}$ ．

Rerun the previous integration problem with this new limit of integration：

| Keys： | Display： | Description： |
| :---: | :---: | :---: |
| 0 ENTER E 3 | 1E3＿ | New upper limit． |
| $\rightarrow$ EQN | X X EXF（－X） | Selects Equation mode；displays the equation． |
| H 10 | $\begin{aligned} & \text { INTEGRTINE } \\ & \int= \\ & 1 . \text { 日可明 } \end{aligned}$ | Integral．（The calculation takes minute or two．） |

This is the correct answer, but it took a very long time. To understand why, compare the graph of the function between $x=0$ and $x=10^{3}$, which looks about the same as that shown in the previous example, with the graph of the function between $x=0$ and $x=10$ :

You can see that this function is "interesting" only at small values of $x$. At greater values of $x$, the function is not interesting, since it decreases smoothly and gradually in a predictable manner.

The algorithm samples the function with higher densities of sample points until the disparity between successive approximations becomes sufficiently small. For a narrow interval in an area where the function is interesting, it takes less time to reach this critical density.

To achieve the same density of sample points, the total number of sample points required over the larger interval is much greater than the number required over the smaller interval. Consequently, several more iterations are required over the larger interval to achieve an approximation with the same accuracy, and therefore calculating the integral requires considerably more time.

## E-8 More about Integration

Because the calculation time depends on how soon a certain density of sample points is achieved in the region where the function is interesting, the calculation of the integral of any function will be prolonged if the interval of integration includes mostly regions where the function is not interesting. Fortunately, if you must calculate such an integral, you can modify the problem so that the calculation time is considerably reduced. Two such techniques are subdividing the interval of integration and transformation of variables. These methods enable you to change the function or the limits of integration so that the integrand is better behaved over the interval(s) of integration.

## Messages

The calculator responds to certain conditions or keystrokes by displaying a message. The $\mathbf{A}$ symbol comes on to call your attention to the message. For significant conditions, the message remains until you clear it. Pressing $[\mathbf{C}$ or $\leftrightarrows$ clears the message; pressing any other key clears the message and executes that key's function.

## Operation Index

This section is a quick reference for all functions and operations and their formulas, where appropriate. The listing is in alphabetical order by the function's name. This name is the one used in program lines. For example, the function named FIX $n$ is executed as DISPLAY $\{$ FIX\} n.

Nonprogrammable functions have their names in key boxes. For example, $\boxed{\text {. }}$
Non-letter and Greek characters are alphabetized before all the letters; function names preceded by arrows (for example, $\rightarrow \mathrm{DEG}$ ) are alphabetized as if the arrow were not there.

The last column, marked $*$, refers to notes at the end of the table.

| A through Z | RCL variable or STO variable Value of named variable. | 6-4 | 2 |
| ABS | ( - ABS Absolute value. Returns $\|x\|$. | 4-16 | 1 |
| ACOS | (G) ACOS Arc cosine. <br> Returns $\cos ^{-1} \mathrm{x}$. | 4-4 | 1 |
| ACOSH | (G) HYP (园 ACOS <br> Hyperbolic arc cosine. Returns cosh ${ }^{-1} x$. | 4-6 | 1 |
| ( ALG | Activates Algebraic mode. | 1-10 |  |
| ALOG | $10^{x}$ Common exponential. Returns 10 raised to the specified power (antilogarithm). | 6-15 | 2 |
| ALL | DISPLAY \{ FLL \} <br> Selects display of all significant digits. | 1-20 |  |
| ASIN | (团ASIN Arc sine Returns $\sin ^{-1} x$. | 4-4 | 1 |

| Name | Keys and Description | Page | ＊ |
| :---: | :---: | :---: | :---: |
| ASINH | （G］HYP $\mathbf{A}$ ASIN <br> Hyperbolic arc sine． Returns $\sinh ^{-1} x$ ． | 4－6 | 1 |
| ATAN | （－7）ATAN Arc tangent． Returns $\tan ^{-1} x$ ． | 4－4 | 1 |
| ATANH | （ $\mathbf{- 1}$ HYP ATAN Hyperbolic arc tangent． Returns tanh ${ }^{-1} x$ ． | 4－6 | 1 |
| $b$ | ［⿴囗 <br> Returns the $y$－intercept of the regression line：$\overline{\mathrm{Y}}-m \overline{\mathrm{X}}$ ． | 11－10 | 1 |
| （⿴囗 BASE | Displays the base－conversion menu． | 10－1 |  |
| BIN | （ BASE $_{\text {\｛BIN\}}}$ <br> Selects Binary（base 2）mode． | 10－1 |  |
| C | Turns on calculator；clears $x$ ； clears messages and prompts； cancels menus；cancels catalogs； cancels equation entry；cancels program entry；halts execution of an equation；halts a running program． | $\begin{gathered} 1-1 \\ 1-4 \\ 1-9 \\ 1-24 \\ 6-3 \\ 12-6 \\ 12-17 \end{gathered}$ |  |
| ／c | displayed fractions to $x$ ．If $x=1$ ， displays current／ c value． | 5－5 |  |
| $\rightarrow{ }^{\circ} \mathrm{C}$ | 畏 $\rightarrow^{\circ} \mathrm{C}$ Converts ${ }^{\circ} \mathrm{F}$ to ${ }^{\circ} \mathrm{C}$ ． | 4－13 | 1 |
| CB | ［团 $x^{3}$ Cube of argument． | 6－15 | 2 |
| CBRT | （4）［5］Cube root of argument． | 6－15 | 2 |
| CF n | $\text { FLAGS }\{C F\} n$ <br> Clears flag n （ $\mathrm{n}=0$ through 11）． | 13－11 |  |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| (6) CLEAR | Displays menu to clear numbers or parts of memory; clears indicated variable or program from a MEM catalog; clears displayed equation. | $\begin{gathered} 1-6 \\ 1-24 \end{gathered}$ |  |
| (6) CLEAR \{PLL\} | Clears all stored data, equations, and programs. | 1-24 |  |
| (6) CLEAR \{PCM | Clears all programs (calculator in Program mode). | 12-20 |  |
| (4) CLEAR \{EQㅏㅜ | Clears the displayed equation (calculator in Program mode). | 12-6 |  |
| CLI | CLEAR $\{\bar{\Sigma}\}$ <br> Clears statistics registers. | 11-11 |  |
| CLVARS | Clears all variables to zero. | 3-4 |  |
| CLx | CLEAR $\{\times\}$ <br> Clears $x$ (the X-register) to zero. | $\begin{gathered} 2-2 \\ 2-6 \\ 12-6 \end{gathered}$ |  |
| $\rightarrow \mathrm{CM}$ | (6) $\qquad$ Converts inches to centimeters. | 4-13 | 1 |
| (6) CMPLX | Displays the CMPLX_ prefix for complex functions. | 9-2 |  |
| CMPLX +/- | (4] CMPLX + Complex <br> change sign. <br> Returns $-\left(z_{x}+i z_{y}\right)$. | 9-2 |  |
| CMPLX + |  addition. Returns $\left(z_{1 x}+i z_{y}\right)+$ $\left(z_{2 x}+i z_{2 y}\right)$. | 9-2 |  |
| CMPLX - | $\square$ Complex subtraction. <br> Returns $\left(z_{1 x}+i z_{y}\right)-\left(z_{2 x}+i\right.$ z2y). | 9-2 |  |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| CMPLX $\times$ | CMPLX $\triangle$ Complex multiplication. <br> Returns $\left(z_{1 x}+i z_{1 y}\right) \times\left(z_{2 x}+i\right.$ z2y). | 9-2 |  |
| CMPLX - | CMPLX $\doteqdot$ Complex division. Returns $\left(z_{1 x}+i z_{1 y}\right) \div$ $\left(z_{2 x}+i z_{2 y}\right) .$ | 9-2 |  |
| CMPLXI/ $x$ | (G] CMPLX $1 / x$ Complex reciprocal. Returns $1 /\left(z_{x}+i z_{y}\right)$. | 9-2 |  |
| CMPLXCOS | CMPLX COS Complex cosine. Returns $\cos \left(z_{x}+i z_{y}\right)$. | 9-2 |  |
| CMPLXe ${ }^{\text {x }}$ | CMPLX $e^{x}$ <br> Complex natural exponential. Returns $e^{\left(z_{x}+i z_{y}\right)}$. | 9-2 |  |
| CMPLXLN | (G] CMPLX LN <br> Complex natural log. Returns $\log _{e}\left(z_{x}+i z_{y}\right)$. | 9-2 |  |
| CMPLXSIN | (G) CMPLX SIN Complex sine. Returns $\sin \left(z_{x}+i z_{y}\right)$. | 9-2 |  |
| CMPLXTAN | CMPLX TAN Complex tangent. Returns $\tan \left(z_{x}+i z_{y}\right)$. | 9-2 |  |
| CMPLXy ${ }^{\text {x }}$ | (G] CMPLX ${ }^{[x]}$ Complex power. | 9-2 |  |
|  | $\text { Returns }\left(z_{1 x}+i z_{1 y}\right)^{\left(z_{2 x}+i z_{2 y}\right)} \text {. }$ |  |  |
| Cn, r | (园Cr Combinations of $n$ items taken $r$ at a time. Returns $n!\div(r!(n-r)!)$. | 4-14 | 2 |
| cos | COS Cosine. <br> Returns $\cos x$. | 4-3 | 1 |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| COSH | (G] HYP COS Hyperbolic cosine. Returns cosh $x$. | 4-6 | 1 |
| $\square$ CONST | Functions to use 40 physics constants. | 4-8 |  |
| DEC | (⿴囗 BASE \{DEC $\}$ <br> Selects Decimal mode. | 10-1 |  |
| DEG | MODES \{DEG\} <br> Selects Degrees angular mode. | 4-4 |  |
| $\rightarrow$ DEG | $\rightarrow$ (GEG Radians to degrees. Returns (360/2 $\pi$ ) x. | 4-13 | 1 |
| DISPLAY | Displays menu to set the display format. | 1-19 |  |
| DSE variable | DSE variable <br> Decrement, Skip if Equal or less. For control number ccccccc.fffii stored in a variable, subtracts ii (increment value) from ccccccc (counter value) and, if the result $\leq$ sff (final value), skips the next program line. | 13-18 |  |
| E | Begins entry of exponents and adds " $E$ " to the number being entered. Indicates that a power of 10 follows. | 1-14 | 1 |
| ENG n | DISPLAY \{ENG\} $n$ <br> Selects Engineering display with $n$ digits following the first digit ( $n=$ 0 through 11). | 1-20 |  |
| $\begin{aligned} & \text { ENG and } \\ & \text { EENG } \end{aligned}$ | Causes the exponent display for the number being displayed to change in multiple of 3 . | 1-20 |  |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| ENTER | Separates two numbers keyed in sequentially; completes equation entry; evaluates the displayed equation (and stores result if appropriate). | $\begin{gathered} 1-17 \\ 6-4 \\ 6-11 \end{gathered}$ |  |
| ENTER | ENTER <br> Copies $x$ into the $Y$-register, lifts $y$ into the Z-register, lifts $z$ into the T-register, and loses $t$. | 2-5 |  |
| E EQN | Activates or cancels (toggles) Equation-entry mode. | $\begin{gathered} 6-3 \\ 12-6 \end{gathered}$ |  |
| $\mathrm{e}^{\mathrm{x}}$ | $e^{x}$ Natural exponential. Returns e raised to the $x$ power. | 4-1 | 1 |
| EXP | $e^{x}$ Natural exponential. <br> Returns e raised to the specified power. | 6-15 | 2 |
| $\rightarrow{ }^{\circ} \mathrm{F}$ | (r) $\rightarrow^{\circ} \mathrm{F}$ Converts ${ }^{\circ} \mathrm{C}$ to ${ }^{\circ} \mathrm{F}$. | 4-13 | 1 |
| 囫 FDISP | Turns on and off Fraction-display mode. | 5-1 |  |
| FIX $n$ | DISPLAY $\{$ FIX\} $n$ <br> Selects Fixed display with $n$ decimal places: $0 \leq n \leq 11$. | 1-19 |  |
| B FLAGS | Displays the menu to set, clear, and test flags. | 13-11 |  |
| $\mathrm{FN}=$ label | FN $=$ label <br> Selects labeled program as the current function (used by SOLVE and $\int \mathrm{FN}$ ). | $\begin{aligned} & 14-1 \\ & 14-7 \end{aligned}$ |  |
| FP | (FP) Fractional part of $x$. | 4-16 | 1 |

| Name | Keys and Description | Page | ＊ |
| :---: | :---: | :---: | :---: |
| FS？$n$ | FLAGS $\{$ FS？\}n <br> If flag $n(n=0$ through 11$)$ is set， executes the next program line；if flag $n$ is clear，skips the next program line． | 13－11 |  |
| $\rightarrow \mathrm{GAL}$ | $\rightarrow \rightarrow$ gal Converts liters to gallons． | 4－13 | 1 |
| GRAD | MODES \｛ERAD\} <br> Sets Grads angular mode． | 4－4 |  |
| GTO label | GTO label <br> Sets the program pointer to the beginning of program label in program memory． | $\begin{gathered} 13-4 \\ 13-17 \end{gathered}$ |  |
| $\underset{\text { nnnn }}{\text { GTO label }}$ | Sets program pointer to line nnnn of program label． | 12－19 |  |
| （G］GTO $\cdot \square$ | Sets program pointer to PRGM TOP． | 12－19 |  |
| HEX | （⿴囗大 BASE \｛HEX\} <br> Selects Hexadecimal（base 16） mode． | 10－1 |  |
| （囫） | Displays the HYP＿prefix for hyperbolic functions． | 4－6 |  |
| $\rightarrow \mathrm{HMS}$ | $\square$ <br> Hours to hours，minutes，seconds． Converts x from a decimal fraction to hours－minutes－seconds format． | 4－12 | 1 |
| $\rightarrow H R$ | $\square$ <br> Hours，minutes，seconds to hours． Converts x from hours－minutes－seconds format to a decimal fraction． | 4－12 | 1 |
| i | RCL i or STO］i <br> Value of variable $i$ ． | 6－4 | 2 |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| (i) | (RCL (i) STO (i) <br> Indirect. Value of variable whose letter corresponds to the numeric value stored in variable i. | $\begin{gathered} 6-4 \\ 13-21 \end{gathered}$ | 2 |
| $\rightarrow \mathbb{N}$ | $\rightarrow$ in Converts centimeters to inches. | 4-13 | 1 |
| IDIV | INT $\div$ Produces the quotient of a division operation involving two integers. | 6-15 | 2 |
| INT - | (⿴囗 INT $\div$ Produces the quotient of a division operation involving two integers. | 4-2 | 1 |
| INTG | $\rightarrow$ INTG Obtains the greatest integer equal to or less than given number. | 4-16 | 1 |
| INPUT variable | INPUT variable <br> Recalls the variable to the X-register, displays the variable's name and value, and halts program execution. Pressing R/S (to resume program execution) or $\downarrow$ (to execute the current program line) stores your input in the variable. (Used only in programs.) | 12-11 |  |
| INV | 1/x] Reciprocal of argument. | 6-15 | 2 |
| IP | (®) Integer part of $x$. | 4-16 | 1 |
| ISG variable | Increment, Skip if Greater. <br> For control number ccccccc.fffii stored in variable, adds ii (increment value) to ccccccc (counter value) and, if the result > fff (final value), skips the next program line. | 13-18 |  |

| Name | Keys and Description | Page | ＊ |
| :---: | :---: | :---: | :---: |
| $\rightarrow K G$ | （ $\rightarrow \mathrm{kg}$ Converts pounds to kilograms． | 4－13 | 1 |
| $\rightarrow \mathrm{L}$ | （ $\rightarrow$ Converts gallons to liters． | 4－13 | 1 |
| LASTx | Returns number stored in the LAST X register． | 2－7 |  |
| $\rightarrow \mathrm{LB}$ | Converts kilograms to pounds． | 4－13 | 1 |
| LBL label | （ LBL label <br> Labels a program with a single letter for reference by the XEQ， GTO，or FN＝operations．（Used only in programs．） | 12－3 |  |
| LN | LN Natural logarithm． <br> Returns $\log _{e} x$ ． | 4－1 | 1 |
| LOG | LOG Common logarithm． Returns $\log _{10} x$ ． | 4－1 | 1 |
| ［ | Displays menu for linear regression． | 11－4 |  |
| m | L．R．$\{m\}$ <br> Returns the slope of the regression line：$\left[\Sigma\left(x_{i}-\bar{x}\right)\left(y_{i}-\bar{y}\right)\right] \div \Sigma\left(x_{i}-\bar{x}\right)^{2}$ | 11－7 | 1 |
| （⿴囗 MEM | Displays the amount of available memory and the catalog menu． | 1－24 |  |
| （⿴囗 MEM \｛FCM \} | Begins catalog of programs． | 12－20 |  |
|  | Begins catalog of variables． | 3－3 |  |
| MODES | Displays menu to set angular modes and the radix（ $\cdot$ or＇）． | $\begin{gathered} 1-18 \\ 4-4 \end{gathered}$ |  |
| n | SUMS $\{\pi\}$ <br> Returns the number of sets of data points． | 11－10 | 1 |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| OCT | BASE $\{0 \mathrm{CT}\}$ <br> Selects Octal (base 8) mode. | 10-1 |  |
| P OFF | Turns the calculator off. | 1-1 |  |
| Pn,r | $n \mathrm{nPr}$ Permutations of $n$ items taken $r$ at a time. Returns $n!\div(n-$ $r)!$. | 4-14 | 2 |
| (4) PRGM | Activates or cancels (toggles) Program-entry mode. | 12-5 |  |
| PSE | PSEE Pause. <br> Halts program execution briefly to display $x$, variable, or equation, then resumes. (Used only in programs.) | $\begin{aligned} & 12-16 \\ & 12-17 \end{aligned}$ |  |
| r | $\rightarrow$ L.R. $\{r\}$ Returns the correlation coefficient between the $x$ - and $y$-values: $\frac{\sum\left(x_{i}-\bar{x}\right)\left(y_{i}-\bar{y}\right)}{\sqrt{\sum\left(x_{i}-\bar{x}\right)^{2} \times\left(y_{i}-\bar{y}\right)^{2}}}$ | 11-7 | 1 |
| RAD | MODES \{RAR $\}$ <br> Selects Radians angular mode. | 4-4 |  |
| $\rightarrow$ RAD | $\rightarrow$ RAD Degrees to radians. Returns $(2 \pi / 360) x$. | 4-13 | 1 |
| RADIX, | MODES $\{s\}$ <br> Selects the comma as the radix mark (decimal point). | 1-18 |  |
| RADIX | MODES \{ $\cdot\}$ <br> Selects the period as the radix mark (decimal point). | 1-18 |  |
| RANDOM | RAND Executes the RANDOM function. Returns a random number in the range 0 through 1. | 4-14 | 1 |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| RCL variable | $\square$ variable <br> Recall. <br> Copies variable into the X-register. | 3-5 |  |
| RCL+ variable | RCL $\dagger$ variable <br> Returns $x+$ variable. | 3-5 |  |
| RCL- variable | RCL $\square$ variable. <br> Returns $x$ - variable. | 3-5 |  |
| RCLx variable | RCL $\times$ variable. Returns $x \times$ variable. | 3-5 |  |
| RCL: variable | RCL $\doteqdot$ variable. <br> Returns $x \div$ variable. | 3-5 |  |
| RMDR | Rmdr Produces the remainder of a division operation involving two integers. | 6-15 | 2 |
| RND | RND Round. <br> Rounds $x$ to $n$ decimal places in FIX $n$ display mode; to $n+1$ significant digits in $\mathrm{SCl} n$ or ENG $n$ display mode; or to decimal number closest to displayed fraction in Fraction-display mode. | $\begin{gathered} 4-16 \\ 5-7 \end{gathered}$ | 1 |
| R RPN | Activates Reverse Polish notation. | 1-10 |  |
| RTN | RTN Return. <br> Marks the end of a program; the program pointer returns to the top or to the calling routine. | $\begin{aligned} & 12-3 \\ & 13-2 \end{aligned}$ |  |
| $R \downarrow$ | R Roll down. <br> Moves $t$ to the Z-register, $z$ to the Y-register, $y$ to the $X$-register, and $x$ to the T-register in RPN mode. Displays the X1~X4 menu to review the stack in ALG mode. | $\begin{aligned} & 2-3 \\ & \mathrm{C}-6 \end{aligned}$ |  |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| $\mathrm{R} \uparrow$ | RT Roll up. | 2-3 |  |
|  | Moves $t$ to the $X$-register, $z$ to the T-register, $y$ to the Z-register, and $x$ to the Y-register in RPN mode. | C-6 |  |
|  | Displays the $\mathrm{X1} \sim \mathrm{X4}$ menu to review the stack in ALG mode. |  |  |
| $\rightarrow$ S, | Displays the standard-deviation Menu. | 11-4 |  |
| SCl n | DISPLAY \{SCI\}n <br> Selects Scientific display with $n$ decimal places. ( $n=0$ through 11.) | 1-19 |  |
| SEED | random-number sequence with the seed $\|x\|$. | 4-14 |  |
| SF $n$ | (GLAGS $\{\mathrm{SF}\} n$ <br> Sets flag $n$ ( $n=0$ through 11). | 13-11 |  |
| SGN | SGN Indicates the sign of $x$. | 4-16 | 1 |
| ¢ SHOW | Shows the full mantissa (all 12 digits) of $x$ (or the number in the current program line); displays hex checksum and decimal byte length for equations and programs. | $\begin{gathered} 6-18 \\ 12-21 \end{gathered}$ |  |
| SIN | SIN Sine. <br> Returns $\sin x$. | 4-3 | 1 |
| SINH | (G] HYP SIN Hyperbolic sine. <br> Returns sinh $x$. | 4-6 | 1 |
| SOLVE variable | SOLVE variable <br> Solves the displayed equation or the program selected by $\mathrm{FN}=$, using initial estimates in variable and $x$. | $\begin{gathered} 7-1 \\ 14-1 \end{gathered}$ |  |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| SPACE | R/S Inserts a blank space character during equation entry. | 13-14 | 2 |
| SQ | $x^{2}$ Square of argument. | 6-15 | 2 |
| SQRT | ( $\times$ Square root of $x$. | 6-15 | 2 |
| STO variable | STO variable <br> Store. Copies $x$ into variable. | 3-2 |  |
| STO + variable | STO] $\dagger$ variable <br> Stores variable $+x$ into variable. | 3-4 |  |
| STO - variable | STO $\square$ variable <br> Stores variable $-x$ into variable. | 3-4 |  |
| STO $\times$ variable | STO $\boldsymbol{x}$ variable <br> Stores variable $\times x$ into variable. | 3-4 |  |
| STO $\div$ variable | STO $\dagger$ variable <br> Stores variable $\div x$ into variable. | 3-4 |  |
| STOP | R/S Run/stop. <br> Begins program execution at the current program line; stops a running program and displays the X-register. | 12-17 |  |
| $\square$ SUMS | Displays the summation menu. | 11-4 |  |
| sx | Returns sample standard deviation of $x$-values: $\sqrt{\sum\left(x_{i}-\bar{x}\right)^{2} \div(n-1)}$ | 11-6 | 1 |
| sy | Returns sample standard deviation of $y$-values: $\sqrt{\sum\left(y_{i}-\bar{y}\right)^{2} \div(n-1)}$ | 11-6 | 1 |

| Name | Keys and Description | Page | ＊ |
| :---: | :---: | :---: | :---: |
| TAN | TAN Tangent．Returns tan $x$ ． | 4－3 | 1 |
| TANH | （G］TYP TAN Hyperbolic tangent． Returns tanh $x$ ． | 4－6 | 1 |
| VIEW variable | VIEW variable <br> Displays the labeled contents of variable without recalling the value to the stack． | $\begin{gathered} 3-3 \\ 12-13 \end{gathered}$ |  |
| XEQ | Evaluates the displayed equation． | 6－12 |  |
| XEQ label | XEQ label <br> Executes the program identified by label． | 13－2 |  |
| $x^{2}$ | $x^{2}$ Square of $x$ ． | 4－2 | 1 |
| $x^{3}$ | （⿴囗 $x^{3}$ Cube of $x$ ． | 4－2 | 1 |
| $\sqrt{x}$ | （x）Square root of $x$ ． | 4－2 | 1 |
| $\sqrt[3]{ } \mathrm{x}$ | ［ $\sqrt{\sqrt[3]{x}}$ Cube root of $x$ ． | 4－2 | 1 |
| $\sqrt[x]{y}$ | 赌 The $x^{\text {th }}$ root of $y$ ． | 4－2 | 1 |
| $\overline{\mathrm{x}}$ | $\bar{x}, \bar{y}\{\bar{x}\}$ <br> Returns the mean of $x$ values： $\Sigma x_{i} \div n .$ | 11－4 | 1 |
| $\hat{\mathrm{x}}$ | L．R．$\{\hat{X}\}$ <br> Given a $y$－value in the $X$－register， returns the $x$－estimate based on the regression line：$\hat{\mathrm{x}}=(y-\mathrm{b}) \div$ m ． | 11－10 | 1 |
| $x$ ！ | （G］$x$ Factorial（or gamma）． <br> Returns $(x)(x-1) \ldots(2)(1)$ ，or $\Gamma(x$ +1 ）． | 4－14 | 1 |
| XROOT | ${ }^{x / y}$ The argumentp root of argument2． | 6－15 | 2 |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| $\overline{\mathrm{X}}$ w | Returns weighted mean of $x$ values: $\left(\Sigma y_{i} x_{i}\right) \div \Sigma y_{i}$. | 11-4 | 1 |
| $\rightarrow \bar{x}, \bar{y}$ | Displays the mean (arithmetic average) menu. | 11-4 |  |
| $x<>$ variable | $x>1$ exchange. <br> Exchanges $x$ with a variable. | 3-6 |  |
| $x<>y$ | $x \triangleleft y$ x exchange $y$. <br> Moves $x$ to the Y-register and $y$ to the X -register. | 2-4 |  |
| (6) $x$ ? ${ }^{\text {a }}$ | Displays the " $x$ ? $y$ " comparison tests menu. | 13-7 |  |
| $x \neq y$ | (G) $x ? y$ \{ $\{\neq\}$ <br> If $x \neq y$, executes next program line; if $x=y$, skips next program line. | 13-7 |  |
| $x \leq y ?$ | (-) $x ? y$ \{ $\}$ <br> If $x \leq y$, executes next program line; if $x>y$, skips next program line. | 13-7 |  |
| $x<y ?$ | (4) $x ? y$ \{<\} <br> If $x<y$, executes next program line; if $x \geq y$, skips next program line. | 13-7 |  |
| $x>y ?$ | (a) $x ? y$ \{>\} <br> If $x>y$, executes next program line; if $x \leq y$, skips next program line. | 13-7 |  |
| $x \geq y$ ? | (4) $x ? y$ \{ $\{\geq$ <br> If $x \geq y$, executes next program line; if $x<y$, skips next program line. | 13-7 |  |
| $x=y ?$ | (4) $x ? y$ \{ $=\}$ <br> If $x=y$, executes next program line; if $x \neq y$, skips next program line. | 13-7 |  |
| $\rightarrow x ? 0$ | Displays the " $x$ ?0" comparison tests menu. | 13-7 |  |

| Name | Keys and Description | Page | * |
| :---: | :---: | :---: | :---: |
| $x \neq 0$ ? | $x ? 0$ \{ $\neq\}$ <br> If $x \neq 0$, executes next program line; if $x=0$, skips the next program line. | 13-7 |  |
| $x \leq 0$ ? | (T) X?0 $\{\leq\}$ <br> If $x \leq 0$, executes next program line; if $x>0$, skips next program line. | 13-7 |  |
| $x<0$ ? | $x ? 0\{<\}$ <br> If $x<0$, executes next program line; <br> if $x \geq 0$, skips next program line. | 13-7 |  |
| $x>0$ ? | $x ? 0 \quad\{>\}$ <br> If $x>0$, executes next program line; <br> if $x \leq 0$, skips next program line. | 13-7 |  |
| $x \geq 0$ ? | $\rightarrow x ? 0\{\geq\}$ <br> If $x \geq 0$, executes next program line; if $x<0$, skips next program line. | 13-7 |  |
| $x=0$ ? | $x ? 0$ \{=\} <br> If $x=0$, executes next program line; <br> if $x \neq 0$, skips next program lire: | 13-7 |  |
| $\bar{y}$ | $\overline{\bar{x}_{x}, \bar{y}}\{\overline{\bar{y}}\}$ <br> Returns the mean of $y$ values. $\Sigma y_{i} \div n .$ | 11-4 | 1 |
| $\hat{y}$ | L.R. $\{\hat{y}\}$ <br> Given an $x$-value in the X-register, returns the $y$-estimate based on the regression line: $\hat{y}$ $=m x+b$. | 11-10 | 1 |
| $y, x \rightarrow \theta, r$ | coordinates. Converts ( $x, y$ ) to ( $r$, $\theta)$. | 4-10 |  |

| Name | Keys and Description | Page | $*$ |
| :--- | :--- | :---: | :---: |
| $y^{x}$ | $y^{x}$ <br> Returns $y$ raised to the $x^{\text {th }}$ power. | $4-2$ | 1 |

## Notes:

1. Function can be used in equations.
2. Function appears only in equations.

Batteries are delivered with this product, when empty do not throw them away but collect as small chemical waste.

Bij dit produkt zijn batterijen. Wanneer deze leeg zijn, moet u ze niet weggooien maar inleveren als KCA.

[^0]:    Note In RPN mode, type in both numbers (separate them by selecting ENTER ) before selecting a function key.

[^1]:    
    

[^2]:    Programs written for ALG mode should normally have an＂＝＂ （ENTER）as the last instruction in the program（before the RTN instruction）．This will complete any pending calculations and allow the user to re－use the result of the program in further calculations． To enter an equation in a program line，see the instructions below．
